

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

PREFACE.

THE author has again been required to subject his Medical Lexicon to a thorough revision. The progress of Medical Science, and the consequent introduction of new subjects and terms, demanded this; and he has embraced the occasion to render more complete the etymology and accentuation of the terms. On no previous revision has so much time and labor been expended by him. Some idea may be formed of this, from the fact, that although the page has been augmented in all its dimensions, not fewer than between sixty and seventy pages have been added.

As the author has remarked on former occasions, it has ever been his ardent wish to make the work a satisfactory and desirable—if not indispensable—lexicon, in which the inquirer may search, without disappointment, for every term that has been legitimated in the nomenclature of the science; and he confidently presents this edition as having more claims on the attention of the practitioner and student than its predecessors.

Once more the author gladly seizes the opportunity afforded him to express his grateful acknowledgments for the vast amount of favor which has been extended to the Dictionary.

TO THE SECOND EDITION.

THE present undertaking was suggested by the frequent complaints, made by the author's pupils, that they were unable to meet with information on numerous topics of professional inquiry,—especially of recent introduction,—in the medical dictionaries accessible to them.

It may, indeed, be correctly affirmed, that we have no dictionary of medical subjects and terms which can be looked upon as adapted to the state of the science. In proof of this, the author need but remark, that he has found occasion to add several thousand medical terms, which are not to be met with in the only medical lexicon at this time in circulation in the country.

The present edition will be found to contain many hundred more terms than the first, and to have experienced numerous additions and modifications.

The author's object has not been to make the work a mere lexicon or dictionary of terms, but to afford, under each, a condensed view of its various medical relations, and thus to render the work an epitome of the existing condition of medical science. In its preparation he has freely availed himself of the English, French and German works of the same nature, and has endeavored to add every subject and term of recent introduction, which has fallen under his notice; yet, with all his care, it will doubtless be found that subjects have been omitted. The numerous additions, however, which he has made, and his strong desire to be useful, "by removing rubbish and clearing obstructions from the paths through which learning and genius press forward to conquest and glory," will, he trusts, extenuate these and other objections that might be urged against the work; especially when the toil which every compiler of a dictionary must endure, is taken into consideration; a toil which has been so forcibly depicted by the great English Lexicographer, as well as by the distinguished SCALIGER, [in an epigram written after he had made an index to the "Inscriptions" of GRUTER:

"Si quem dura manet sententia Judicis olim,
 Damnatum ærumnis supplicilsque caput;
Hunc neque fabrili lassent ergastula massâ
 Nec rigidas vexent fossa metalla manus,
Lexica contexat; nam cætera quid moror? Omnes
 Pœnarum facies hic labor unus habet."

Thus freely rendered in French:—]

"Si quelqu'un a commis quelque crime odieux,
S'il a tué son père, ou blasphémé les Dieux,
Qu'il fasse un Lexicon: s'il est supplice au monde
Qui le punisse mieux, je veux que l'on me tonde."

EXPLANATION.

IF the simple synonymy of any term be desired, a mere reference to the term may be sufficient; but if farther information, as to meaning or accentuation, be needed, it may be obtained under the term referred to. For instance, under *Cimicifuga*, reference is made to *Actæa racemosa*, as a synonyme. This may be sufficient for the inquirer; but should he desire to know the accentuation and properties of the plant, he must turn to *Actæa racemosa*. In the same manner, the French word *Tronc* is defined *Trunk*. This may be sufficient: should it not, the requisite information may be found under *Trunk*. In terms of more words than one, the definition is generally given under the more significant word; but, if not, it will be found under the other:—*Respiratory murmur*, for example, is defined under *Murmur*; *Shaking palsy*, under *Palsy*; *Musculus succingens*, under *Musculus*; *Ocular spectrum*, under *Spectrum*.

When the orthography of the French term is the same as that of the English, or with the mere difference of an accented vowel in the former, the term is not always repeated.

The causes of this accident are referable either to the mother, and particularly to the uterus; or to the fœtus and its dependencies. The causes, in the mother, may be:—extreme nervous susceptibility, great debility, plethora, faulty conformation, &c.; and it is frequently induced immediately by intense mental emotion, violent exercise, &c. ABSORPTIO, Absorption—a. Sanguinis, Hæmorrhophesis.

ABSORP'TION, (same etymon as Absorbent), *Absorp'tio*, *Resorp'tio*, *Inhala'tio*, *Imbibit'io*, *Anar'rhopê*, *Anar'rhophe'sis*, *Catapino'sis*, *Rhæbde'sis*, *Catarrhophe'sis*, *Catar'rhopê*. The function of absorbent vessels, by virtue of which they take up substances from without or within the body. Two great divisions have been made of this function.

1. *External absorption*, or the *absorption of composition*, which obtains, from without the organs, the materials intended for their composition; and, 2. *Internal absorption*, or the *absorption of decomposition*, which takes up from the organs the materials that have to be replaced.

By *external absorption* is meant not only that which takes place at the external surface of the body, but also that of the mucous membranes of the digestive and respiratory passages. Hence, again, the division of external absorption into *cutaneous*—*resorp'tio cuta'nea* seu *cut'is*, *inhala'tio cut'is*,—*intest'inal* or *digestive*, and *pulmonary* or *respiratory*.

Internal absorption is also subdivided into, 1. *Molecular* or *interstit'ial*, *nu'tritive*, *organ'ic*, or *decompo'sing*, which takes up from each organ the materials that constitute it, so that the decomposition is always in equilibrio with the deposition. 2. *The absorption of excrementit'ial secreted fluids*, such as the fluid of serous membranes, synovia, &c. As these are constantly exhaled on surfaces which have no external outlet, they would augment indefinitely if absorption did not remove them in the same proportion as that in which they are deposited. 3. *The absorption of a part of the excrementit'ial secreted fluids*, as they pass over the excretory passages.

The great agents of external absorption are the veins and chyliiferous vessels; of internal absorption, probably the lymphatics. In the chyliiferous vessels and lymphatics the fluid is always found to possess the same general properties. In them, therefore, an action of elaboration or selection must have taken place. The veins, on the other hand, seem to exert no selection. Any fluid, possessing the necessary tenuity, passes through the coats of the vessel readily by imbibition, and proceeds along with the torrent of the circulation. Watery fluids in this manner enter the blood when they are taken into the stomach. Substances that require digestion, on the other hand, may pass through the chyliiferous vessels and thoracic duct.

Concentrated acetic acid, prepared by decomposing an acetate and receiving the acetic acid by distillation, has a very pungent and grateful odour, and an acid and acrid taste. Its s. g. is about 1.046, and it is very volatile.

It is stimulant, rubefacient, and escharotic, and is applied to the nostrils in syncope, asphyxia, headache, &c. It destroys warts.

An Aromatic Spir'it of Vin'egar, *Ac'idum Acē'ticum Camphora'tum*, *A. aceto'sum camphora't*

tum, is formed of this strong acid, f 3x; Camphor, 3j; Alcohol, f 3j.

A strong Acetic Acid was ordered by the London pharmacopœia, prepared from wood. It was called *Vinegar of wood*, *Improved distilled Vinegar*, *Pyroligneous Acid*, *Acetum Ligno'rum*, and its strength was such, that 87 gr. of crystallized subcarbonate of soda should saturate 100 grains of the acid.

Ac'idum Aceticum Dilu'tum, *A. A. ten'u'd seu deb'il'ius*, *Acetum destilla'tum*, *Acidum aceticum*, *Acidum Aceto'sum destilla'tum*, *Distill'd vin'egar*, (F.) *Acide Acétique faible*, *Vinaigre distillé*, is prepared by distilling vinegar, until seven-eighths have passed over. An *Acidum aceticum dilutum*, *Diluted acetic acid*, is made by mixing a pint of the strong acetic acid with seven pints of distilled water.—Ph. U. S. Its properties are like those of vinegar.

By others, however, the terms are applied to *Pyroxylic Spirit*. A limpid, colourless liquid, having a peculiarly penetrating and slightly empyreumatic odour. Its density in the liquid state, is almost the same as that of alcohol, 0.7921. Its taste is disagreeable, and analogous to that of peppermint. It is miscible in all proportions with water, alcohol, and ether. It may be prepared by distilling a mixture of two parts of crystallized acetate of lead and one part of quicklime in a salt-glaze jar (gray-beard,) the lower part of the jar being coated with fire-clay; and a bent glass tube, half an inch in diameter, adapted to the mouth by a cork, so as to form a distillatory apparatus. The jar is supported on the mouth of a small furnace, by which the lower part only is heated to redness, and the vapours are conducted into a Liebig's condenser. The product is repeatedly redistilled from quicklime, until its boiling point is constant at 132°.

It was brought forward as a remedy in phthisis pulmonalis; but evidently with unfounded pretensions. It is an excitant, and may be serviceable in chronic bronchitis. The dose is ten to forty drops three times a day, diluted with water.

A formula for the preparation of *acidum hydriodicum dilutum* has been introduced into the Pharmacopœia of the United States of 1863. It is a good solvent for iodine.

It has been used in the same cases as the preparations of iodine in general, but is rarely employed.

AIR, (*αἶρ*) *Aër*, (*αἶρ*, 'I breathe.') *Pneu'ma*, *Com'mon Air*, *Atmospher'ic air*, (F.) *Air atmosphé-rique*, is an invisible, transparent, inodorous, in-sipid, ponderable, compressible, and elastic fluid, which, under the form of the atmosphere, sur-rounds the earth to the height of 15 or 16 leagues.

Air is essentially composed of two gases, oxy-gen and nitrogen, in the proportion of about 20 of the former, to 80 of the latter. Oxygen is the vital portion, but the nitrogen is necessary to dilute it. Air also contains a small portion of carbonic acid gas, and has always floating in it aqueous vapour, different terrestrial emanations, etc. Its effects upon the human body vary according to its greater or less density, temperature, moisture, etc. Change of air is found extremely serviceable in the prevention and cure of certain morbid con-ditions. This word was formerly synonymous with Chymistry; but, from the 7th century it has been applied to the mysterious art of endeavouring to discover a universal remedy, and a mode of transmuting the baser metals into gold: an operation to which they gave the name *Opus mag'num*, and *Philosopher's stone*.

Alchymy has also been called *Sciē'tia vel Philosoph'ia Hermet'ica*, from an idea that Hermes or Mercury was its inventor. Harris has well defined this chimerical art: '*Ars sine arte, cujus principium est mentiri, medium laborare, et finis mendicare.*'

tassa. In the Ph. U. S., Alcohol is rectified spirit of the specific gravity 0.835. The Dublin college has a *spiritus fortior*, used in the preparation of certain essences, whose specific gravity is 0.818, and the Pharmacopœia of the United States an *Alcohol Fortius, strong'er al'cohol*, s. g. 0.817. *Alcohol, absolute alcohol*, of the Edinburgh and Dublin Pharmacopœias, is of specific gravity 0.797.

Alcohol is an inflammable liquor, lighter than water, of a warm, acrid taste, colourless, transparent, and of a pungent, aromatic smell. It is the product of the distillation of vinous liquors; is miscible with water in all proportions, and is the direct solvent of resins, balsams, &c. Various other vegetable principles are soluble in it, and hence it is used, in different states of concentration, in the preparation of *elixirs, tinctures, essences*, &c.

Alcohol acts on the animal body as a powerful stimulus: as such, in a dilute form, it is used in the prevention and cure of disease. Its habitual and inordinate use is the cause of many serious affections, of a chronic character especially, as visceral obstructions, dropsy, &c.

The study of aliments forms one of the most important branches of hygiene. Properly, all substances, organic or inorganic, that enter into the composition of organized beings are aliments.

As regards the immediate principles which predominate in their composition, they have been classed, but imperfectly, as follows:—

TABLE OF ALIMENTS.

1. <i>Feculaceous.</i>	Wheat, barley, oats, rye, rice, Indian corn, potato, sago, peas, beans, &c.
2. <i>Mucilaginous.</i>	Carrot, salsify, beet, turnip, asparagus, cabbage, lettuce, artichoke, melon, &c.
3. <i>Saccharine.</i>	Sugar, fig, date, raisin, apricot, &c.
4. <i>Acidulous.</i>	Orange, currant, gooseberry, cherry, peach, strawberry, raspberry, mulberry, prune, pear, apple, sorrel, &c.
5. <i>Oleaginous and Fatty.</i>	Cocoa, olive, sweet almond, nut, walnut, animal fat, oil, butter, &c.
6. <i>Caseous.</i>	Different kinds of milk, cheese.
7. <i>Gelatinous.</i>	Tendon, aponeurosis, true skin, cellular texture; very young animals.
8. <i>Albuminous.</i>	Brain, nerve, eggs, &c.
9. <i>Fibrinous.</i>	Flesh and blood.

Dr. Prout has four great classes—the *aqueous*, *saccharine*, *oleaginous*, and *albuminous*:—Dr. Pereira, twelve—*aqueous*, *mucilaginous* or *gummy*, *saccharine*, *amylaceous*, *lignous*, *pectinaceous*, *acidulous*, *alcoholic*, *oily* or *fatty*, *proteinaceous*, *gelatinous*, and *saline*. Liebig divides them into two classes:—the *NITROGENIZED* OR *PLASTIC ELEMENTS OF NUTRITION*, in which he comprises *vegetable fibrin*, *vegetable albumen*, *vegetable casein*, *flesh* and *blood*; and the *NON-NITROGENIZED* OR *ELEMENTS OF RESPIRATION*, in which he comprises *fat*, *starch*, *gum*, *cane sugar*, *grape sugar*, *sugar of milk*, *pectin*, *bassorin*, *wine*, *beer*, and *spirits*. The former alone, in his view, are inservient to the nutrition of organized tissue: the latter are burnt in respiration, and furnish heat.

The following simple arrangement is, perhaps, as little objectionable as any:—

- | | |
|--------------------------------------|--|
| 1. <i>Nitrogenized Aliments,</i> | { Fibrinous (Glutinous?)
Albuminous.
Caseinous, Gelatinous.
Amylaceous. |
| 2. <i>Non-nitrogenized Aliments,</i> | { Saccharine.
Oleaginous. |
| 3. <i>Inorganic.</i> | |

The second division might be still further simplified, inasmuch as amylaceous aliments are convertible into sugar during the digestive process; and, from both, oleaginous matter may be formed.

Aliments are, at times, divided into the *substantive*, and the *adjective* or *accessory*; the former comprising all the nutritive substances, which are used as food; the latter condiments. See *Condiment*.

It forms a white emulsion with water: is soluble in vinegar; partially so in alcohol, ether, and solutions of the alkalies.

Gum ammoniacum is expectorant, 'deobstruent' (?), antispasmodic, discutient, and resolvent. It is chiefly used, however, in the first capacity, and in the formation of certain plasters.

The term is, now, almost restricted to agents, which produce such effect by being received into the lungs in the form of vapours or gases, and passing with the blood to the nervous centres on which their action is exerted. Perhaps, as a general rule, the intellectual faculties first feel their influence,—a sort of intoxication supervening, with imperfect power of regulating the movements; the sensory ganglia become afterwards or simultaneously affected, sensation and motion are suspended, and ultimately, if the quantity inhaled be sufficient, the medulla oblongata has its actions suspended or destroyed, respiration ceases, and death is the consequence. Different agents have been used as anæsthetics by way of inhalation—sulphuric ether, chloroform, chloric ether, compound ether, chlorohydric and nitric ethers, bisulphure of carbon, chloride of olefant gas, benzin, aldehyde, light coal-tar naphtha, &c.; but the first four are alone employed. ANATOMY, (ανατομη,) *Anat'omē*, *Anatom'ia*, *Anathom'ia*, *Prosec'tio*, (from ανα, and τειννυ, 'to cut.') (F.) *Anatomie*. The word *Anatomy* properly signifies *dissection*; but it has been appropriated to the study and knowledge of the number, shape, situation, structure, and connection—in a word, of all the apparent properties of organized bodies. *Anatomy* is the science of organization. Some have given the term a still more extended accep-

tation, applying it to every mechanical decomposition, even of inorganic bodies. Thus *Cystallography* has been termed the *Anatomy* of crystallized minerals. *Anatomy* has also been called *Morphology*, *Somatology*, *Somatology*, *Orgonology*, etc. It assumes different names, according as the study is confined to one organized being, or to a species or class of beings. Thus, *Andrology*, or *Anthropology*, or *Anthropography*, or *Anthroposomatology*, is the *Anatomy of Man*; *Zoölogy*, that of the other species of the animal kingdom; and *Veterinary Anatomy* is the anatomy of domestic animals; but when the word is used abstractly, it means *Human Anatomy*, and particularly the study of the organs in a physiological or healthy state. *Physiology* of *Anatomy* is occasionally used to signify the kind of anatomy which investigates structure with a special view to function. The *Anatomy* of the diseased human body is called *Pathological* or *Morbid Anatomy*, and when applied to Medical Jurisprudence, *Forensic Anatomy*. Several of the organs possessing a similarity of structure, and being formed of the same tissues, they have been grouped into *Systems* or *Genera of Organs*; and the study of, or acquaintance with, such systems, has been called *General Anatomy*, *Histology*, or *Morphology*, whilst the study of each organ in particular has been termed *Descriptive* or *Special Anatomy*, *Anthropomorphology*. *Histology* is however, more frequently applied to the *Anatomy of the Tissues*, which is called, also, *Textural* and *Microscopic Anatomy*. *Micranatomy*, see *Histology*. *Descriptive Anatomy* has been divided into *Skeletalogy*, which comprises *Osteology* and *Syn-desmology*; and *Sarcology*, which is subdivided into *Myology*, *Neurology*, *Angiology*, *Adeology*, *Splanchnology*, and *Dermatology*. *Surgical Anatomy*, *Medico-surgical Anatomy*, *Topographical Anatomy*, *Regional Anatomy*, (F.) *Anatomie Chirurgicale*, *A. des Régions*, is the particular and relative study of the bones, muscles, nerves, vessels, etc., with which it is indispensable to be acquainted before performing operations. *Comparative* or *Analogical Anatomy* is the comparative study of each organ, with a view to an acquaintance with the modifications of its structure in different animals, or in the different classes of animals; whilst *Homological Anatomy* examines the relations to each other of the different parts of the same individual. *Transcendental* or *Philosophical Anatomy* inquires into the mode, plan, or model upon which the animal frame or organs are formed; *Artificial Anatomy* is the art of modelling and representing, in wax or other substance, the different organs or different parts, of the human body, in the sound or diseased state; and *Clastic Anatomy* (F.) *Anatomie Castique*, (καστ, 'to break,') in the language of *Auzous*, is the formation of models in such sort, that they can be broken or separated into pieces. *Phytology* and *Phytanatomy* is the anatomy of vegetables, and *Pictorial Anatomy*, anatomy artistically illustrated.

Properly, *Aneurism* signifies a tumour, produced by the dilatation of an artery; but it has been extended to lesions of arteries, as well as to dilatations of the heart.

There are various kinds of aneurism. The following are the chief:

I. When the blood, which forms the tumour, is enclosed within the dilated coats of the artery. This is the true *Aneurism*, *Aneurys'ma ve'rūm*, *Her'nia Arteriarum*, (F.) *Anévrisme vrai*.

II. When the blood has escaped from the opened artery, it is called *spurious* or *false An'eurism*, *Aneuris'ma spu'rium*, *Ruptura Arte'ris*, *Arteriorrhex'is*, *Arteriodial'ysis*, *Echymo'ma arterio'rūm*, (F.) *Anévrisme faux*. The latter is divided into

three varieties. 1. *Diffused False Aneurism*, (F.) *Anevrisme faux, primitif, diffus, non circonscrit* ou *par infiltration*, which occurs immediately after the division or rupture of an artery, and consists of an extravasation of blood into the areolar texture of the part. 2. *Circumscribed False Aneurism*, (F.) *Anévrisme faux consécutif, circonscrit* ou *par épanchement, enkysté* ou *saciforme, tumeur hémorrhagiale circonscrite*, in which the blood issues from the vessel some time after the receipt of the wound, and forms itself a sac in the neighbouring areolar tissue. 3. *Aneurism by Anastomosis*, *Varicose* or *Cirroid Aneurism*, *Phlebotriodialysis*, *Aneurysma venoso-arteriosum*, *A. varicosum*, (F.) *Anévrisme par anastomose* ou *variqueux*, *A. par érosion*, *A. de Pott*, *A. des plus petites artères*, which arises from the simultaneous wounding of an artery and a vein;—the arterial blood passing into the vein, and producing a varicose state of it.

III. *Mixed Aneurism*, (F.) *Anévrisme mixte*, is that which arises from the dilatation of one or two of the coats, with division or rupture of the other. Some authors have made two varieties of this:—1. *Mixed external Aneurism*, where the internal and middle coats are ruptured, and the areolar is dilated. 2. *Mixed internal Aneurism*, in which the internal coat is dilated, and protrudes, like a hernial sac, through the ruptured middle and outer coats. This variety has been called *Aneurysma Herniam Arteris sistens*.

Aneurisms have been termed *traumatic* or *exogenous*, and *spontaneous*, according as they may have been caused by a wound, or have originated spontaneously. The latter, when originating from lesions of the inner coats of arteries, have been termed *endogenous*. They have also been divided into *internal* and *external*.

The *internal aneurisms* are situate in the great splanchnic cavities, and occur in the heart and great vessels of the chest, abdomen, &c. Their diagnosis is difficult, and they are often inaccessible to surgical treatment.

The *external aneurisms* are situate at the exterior of the head, neck, and limbs, and are distinctly pulsatory.

Aneurisms, especially the internal, may be combated by a debilitating treatment, on the plan of Valsalva, which consists in repeated blood-letting, with food enough merely to support life. In external aneurism, the artery can be obliterated. This is usually done by applying a ligature above the aneurismal tumour.

ANEURISM BY ANASTOMOSIS, see Aneurism—*a. Brador's* operation for, see Brador—*a. Cirroid*, see Aneurism.

ANEURISM, DISSECTING, is one in which, owing to rupture of the inner and middle coats of an artery, the blood makes itself a channel between these coats and the outer coat.

In many cases, the lesion appears to consist in a separation of the laminae of the middle coat, between which the blood forms itself a channel.

ANEURISM, ENDOGENOUS, see Aneurism, and *Endogenous*—*a. Exogenous*, see Aneurism, and *Exogenous*—*a. External*, see Aneurism—*a. False*, see Aneurism—*a. False*, circumscribed, see Aneurism—*a. False*, diffused, see Aneurism.

ANEURISM OF THE HEART, *Cardionchus*, *Cardiuryuma*, *Cardianeurysma*, (F.) *Anévrisme du cœur*, has been divided into *active* and *passive*. The former can scarcely be esteemed aneurisms, as they most commonly consist of increased thickness of the parietes of the heart, which diminishes its cavity instead of increasing it. The term *Hypertrophy of the heart* better indicates their character. *Passive aneurism*, *Cardiectasis*, on the contrary, is attended with extenuation of the parietes of the organ, and enlargement of the cavities. The physical signs of dilatation of the heart are

the following:—The action of the heart is not visible, and no impulse is conveyed to the hand. On percussion, there is a loss of resonance over a larger surface than usual, but the dulness is much less intense than that which accompanies hypertrophy. On auscultation, the action of the heart is only slightly felt, and communicates at once the impression of its diminished power. The impulse is feebler than usual. Both sounds are widely transmitted over the thorax, and are not much fainter at a distance from their point of origin.

Partial or true aneurism of the Heart—*Cardiectasis partialis*, *Aneurysma consecutum cordis*—is sometimes seen; rarely, however.

The name *Aneurism of the Valves of the Heart* has been given to pouch-like projections of the valves into the auricles.

It is an affection of great danger, and is often connected with ossification, or other morbid condition of the heart. It appears to be neuropathic, and has been termed *Neuralgia of the Heart*. ANGLE, *An'gulus*, (*αγκυλος*, 'a hook.') The space between two lines which meet in a point.

ANGLE, FA'CIAL, pointed out by Camper, is formed by the union of two lines, one of which is drawn from the most prominent part of the forehead to the alveolar edge of the upper jaw, opposite the incisor teeth—the *facial line*—and the other from the meatus auditorius externus to the same point of the jaw. According to the size of the angle it has been attempted to appreciate the respective proportions of the cranium and face, and, to a certain extent, the degree of intelligence of individuals and of animals. In the white varieties of the species, this angle is generally 80°; in the negro not more than 70°, and sometimes only 65°. As we descend the scale of animals, the angle becomes less and less; until, in fishes, it nearly or entirely disappears. Animals which have the snout long, and facial angle small, such as the snipe, crane, stork, &c., are proverbially foolish, at least they are so esteemed; whilst intelligence is ascribed to those in which the angle is more largely developed, as in the elephant and the owl. In these last animals, however, the large facial angle is caused by the size of the frontal sinuses:—so that this mode of appreciating the size of the brain is very inexact, and cannot be depended upon.

The following is a table of the angle in man and certain animals:

Man.....	from 65° to 85° and more.
Sapajou.....	65
Orang-Utang.....	56 to 58
Guenon.....	57
Mandrill.....	30 to 42
Coati.....	28
Pole-Cat.....	31
Pug-Dog.....	35
Mastiff.....	41
Hare.....	30
Ram.....	30
Horse.....	23

ANGLE, OCCIP'ITAL, OF DAUBENTON, is formed by a line drawn from the posterior margin of the foramen magnum to the inferior margin of the orbit, and another drawn from the top of the head to the space between the occipital condyles. In man, these condyles, as well as the foramen magnum, are so situate, that a line drawn perpendicular to them would be a continuation of the spine; but in animals they are placed more or less obliquely; and the perpendicular is necessarily thrown farther forward, and the angle rendered more acute.

The *Anima* of Stahl, *An'ima Stahlia'na*, was a fancied intelligent principle, which he supposed to preside over the phenomena of life,—like the *Archæus* of Van Helmont.

Under the term *Anima Mund'i*, the ancient philosophers meant a universal Spirit, which they supposed spread over every part of the universe.

The precise seat of the mind in the brain has given rise to many speculations. The point is unsettled.

With the ancient chemists, *Anima* meant the active principle of a drug separated by some chemical management.

AN'IMAL, *Zo'ön*. A name given to every animated being. Most animals have the power of locomotion; some can merely execute partial movements, such as contraction and dilatation. (F.) *Chaleur animale*, is the caloric constantly formed by the body of a living animal, by virtue of which it preserves nearly the same temperature, whatever may be that of the medium in which it is placed. This formation seems to take place over the whole body, in the production of carbonic acid, and in other oxidizing processes, and to be connected with the changes in nutrition.

A table of the natural temperatures of many animals—that of man being 100°—is contained in the author's *Human Physiology*, vol. i., Art. *Calorification*.

The *anima* or soul, according to Stahl, is the immediate and intelligent agent of every movement, and of every material change in the body. Stahl therefore concluded, that disease is nothing more than a disturbance or disorder in the economy, or an effort by which the soul, attentive to every morbid cause, endeavours to expel whatever may be deranging the habitual order of health.

The one, *ante'rior*, is a broad, fibrous, quadrilateral band, extending transversely before the carpus, and forming the gutter, made by the wrist, into a canal. It is attached, externally, to the trapezium and scaphoides; and internally to the os pisiforme and process of the unciforme. It keeps the tendons of the flexor muscles, median nerve, &c., applied against the carpus.

The *posterior* ligament is situate transversely behind the joint of the hand, and covers the sheaths of the tendons, which pass to the back of the hand. Its fibres are white and shining, and are attached, externally, to the inferior and outer part of the radius; internally, to the ulna and os pisiforme.

ANNULAR LIG'AMENTS OF THE TAR'SUS are two in number. The *ante'rior* is quadrilateral, and extends transversely above the instep. It is attached to the superior depression of the os calcis, and to the malleolus internus. It embraces the tendons of the extensor muscles of the toes, the *tibialis anticus* and *peroneus anticus*. The *inter'nal* is broader than the last. It descends from the malleolus internus to the posterior and inner part of the os calcis, with which it forms a kind of canal, enclosing the sheaths of the tendons of the *tibialis posticus*, *flexor longus digitorum pedis*, and *F. longus pollicis pedis*, as well as the plantar vessels and nerves.

ANPHRAKOK'ALI, *Lithanthrakok'ali*, (ανθραξ, gen. ανθρακος, 'coal,' and kali, 'potassa.') An article introduced as a remedy in cutaneous diseases. It is formed by dissolving carbonate of potassa in 10 or 12 parts of boiling water, and adding as much slacked lime as will separate the potassa. The filtered liquor is placed on the fire in an iron vessel, and suffered to evaporate, until neither froth nor effervescence occurs, and the liquid presents a smooth surface like oil. To this, levigated coal is added in the proportion of 160 grammes to 192 grammes of potassa. The mixture is stirred, and removed from the fire, and the stirring is continued, until a black homogeneous powder results. A sulphuretted anthrakokali is made by mixing accurately 16 grammes of sulphur with the coal, and dissolving the mixture in the potassa, as directed above. The dose of the simple and the sulphuretted preparations is about two grains three times a day.

ANTHRAX, gen. *Anthraxis*, (ανθραξ, gen. ανθρακος, 'a coal.') *Anthrax*, *Car'bo*, *Rubi'nus co'vus*, *Codexel'ia*, *Erythe'ma gangrenosum*, *Grantristum*, *Præ'na*, *Py'ra*, *Granatristum*, *Phy'ma Anthrax*, *Erythe'ma an'thrax*, *Carbun'culus*, *Anthraco'ria*, *Anthraco'ma*, *Absces'sus gangrenos'cens seu gangrenos'us*, *Furun'culus malig'nus*, *F. gangrenos'us*, *Car'buncle*, (F.) *Charbon*. An inflammation, essentially gangrenous, of the cellular membrane and skin, which may arise from an internal or external cause. The definition by Dr. Good is sufficiently distinctive. Tumour, common to the surface; flat; firm; burning; penetrant; livid and vesicular; or crusty above, with a sordid and gangrenous core below; imperfectly suppurative. It sometimes prevails epidemically; is often owing to a peculiar cachectic condition, and may be induced by the reception of an animal infection into the organism; when it has received the names *Anthrax malig'nus*, *Cocan'thrax*, *Anthra'cion*, *Vesic'ula gangrenos'cens*, *Anthraco'phlyctis*, *Pustula malig'na*, (F.) *Pustule maligne*, *Bouton malin*, and is characterized at the outset by a vesication or bleb filled with a sero-sanguinolent fluid, under which a small induration is formed, surrounded by an areolar inflammation, which becomes gangrenous. It has been thought by some to be induced altogether by contact with the matter of the carbuncle of animals, or of the exuvie of the bodies of such as had died of the disease, but is now known to arise primarily in the human subject. This form of carbuncle has received different names, many of them from the places where it has prevailed:—*Carbunc'ulus contagios'us seu Gal'licus seu Hunga'ricus seu Polon'icus seu Septentriona'lis*, *Per'sicus ignis*, *Mor'bus pustulos'us Fin'nicus*, *Pustula gangrenosa seu livida Estho'nia*, *Pen'phigus Hunga'ricus*, *Puce de Bourgogne ou maligne*, *Feu Persique*, *Malvat de Languedoc*.

ANTIMONIAL POWDER, *Pulvis antimonia'lis* seu *antimonii compos'itus*, (*Oxydum antimonii cum phosphatæ cal'cis*, *Phosphus cal'cis stibiat'us* seu

calcicum stibiat'um, *Pulvis Jame'sii* seu *stibiat'us* seu *de phosphatæ cal'cis et stib'ii compos'itus* seu *Jaco'bi* seu *febrif'ugus Jaco'bi*, *Factitious James's Pow'der*, *Schwan'berg's Fe'cer Pow'der*, *Chen'eciz's Antimon'ial Pow'der*, (F.) *Poudre antimoniale composée* ou *de JAMES*. A peroxide of antimony combined with phosphate of lime. (Take of common sulphuret of antimony, ℥ij; hartshorn shavings, ℥ij. Roast in an iron pot, until they form a gray powder. Put this into a long pot, with a small hole in the cover. Keep it in a red heat for two hours, and grind to a fine powder. In the Ph. B. (1864), *Pulvis antimonialis* is made by mixing thoroughly one ounce of oxide of antimony with two ounces of precipitated phosphate of lime.)

This preparation has long been esteemed as a febrifuge; but it is extremely uncertain in its action. The ordinary dose is 6 or 8 grains.

The original James's Powder—*Pulvis Jaco'bi*, *P. Jaco'bi veteris*—of which the above is a succedaneum, was a patent medicine, so ambiguously described, that the powder of James could not be prepared from the formula. It had an immense reputation, which it did not merit.

Antimonii Oxy-sulphuretum (Ph. U. S., 1863) is considered to be nearly the same as the old *Kermes* or *Chermes Min'eral*. It is prepared by boiling together sulphuret of antimony and carbonate of soda in water; filtering: and washing and dry-

ing the precipitate. It is a powder of a purplish brown colour, and almost devoid of taste. It is emetic, diaphoretic, and cathartic, according to the dose; and has been chiefly used in chronic rheumatism, and in cutaneous affections. Dose, gr. j. to gr. iij.

Sulphuret of antimony is the ore from which all the preparations of antimony are formed. In Pharmacy, it is the native sesquisulphuret of antimony, purified by fusion. When prepared for medical use, by trituration and levigation, it forms a powder, *Antimonii sulphuretum preparatum*, (Ph. D.) of a black or bluish gray colour, which is insoluble. It is slightly diaphoretic and alterative, and has been used in chronic rheumatism, cutaneous diseases, &c.

APOPLEXY, *Apoplex'ia*, (Sc.) *Poplexy*, (αποπληξία, from ἀποπληττειν, 'to strike with violence.') At the present day, the term apoplexy is employed by many writers to signify interstitial hæmorrhage, (F.) *Hémorrhagie interstitielle*, or every effusion of blood, which occurs suddenly into the substance of an organ or tissue. Hence, we speak of cerebral apoplexy, pulmonary apoplexy, &c. &c. Formerly it was always—and still is by many—used in a restricted sense, to signify, in other words, the train of phenomena, which characterize cerebral apoplexy. This disease, *Hæmorrhag'ia Cerebri*, *Aphro'nia*, *Ca'rus Apoplex'ia*, *Co'ma Apoplex'ia*, *Apoplex'ia cerebri sanguinea* seu *cerebra'lis*, *Encephalorrhag'ia*, *Sanguinis ic'tus*, *Hæmatenceph'alum*, *Pulpes'ia*, *Sidera'tio*, *Apileps'ia*, *Mor'bus atton'itus*, *Gul'ta*, *Theople'gia*, *Theoplex'ia*, (F.) *Apoplexie*, *A. cérébrale*, *Hémato'encephalie*, *Coup de sang*, is characterized by diminution, or loss of sensation and mental manifestation; by the cessation, more or less complete, of motion; and by a comatose state,—circulation and respiration continuing. It generally consists in pressure upon the brain; either from turgescence of vessels, or from extravasation of blood: hence the terms *Hæmenceph'alum*, *Hémorrhagie cérébrale*, and *Hémato'encephalorrhagie*, applied to it by some. The general prognosis is unfavourable; especially when it occurs after the age of 35. When Apoplexy is accompanied with a hard, full pulse, and flushed countenance, it is called *Apoplex'ia sanguinea*, *Cataph'ora Co'ma*; when with a feeble pulse and pale countenance, and evidences of serous effusion, *Apoplex'ia serosa*, *A. pituitosa*, *Serous Apoplexy*, *Cataph'ora hydroceph'alica*, *Encephaloch'yria seni'lis*, *Hydroceph'alus acutus senum*, (F.) *Hydro'encephalorrhée* of Piorry, *Hydropisie cérébrale suraiguë*, *Hydrorrhagie*.

Celsus and Galen called thus the membrane of the vitreous humour,—the *tunica hyaloidea*. The moderns use it now for one of the membranes of the brain, situate between the dura mater and pia mater. It is a serous membrane, and composed of two layers; the external being confounded, in the greater part of its extent, with the dura mater, and, like it, lining the interior of the cranium and spinal canal; the other being extended over the brain, from which it is separated by the pia mater, without passing into the sinuosities between the convolutions, and penetrating into the interior of the brain by an opening at its posterior part under the corpus callosum. It forms a part of the investing sheath of the nerves, as they pass from the encephalic cavities. Its chief uses seem to be:—to envelop, and, in some measure, protect the brain, and to secrete a fluid for the purpose of keeping it in a state best adapted for the proper performance of its functions.

and Van Helmont. The latter used it for the internal principle of our motions and actions. This archæus, according to Van Helmont, immaterial principle, existing prior to fecundation, and presiding over the development of the body, and over all organic phenomena. Besides this chief archæus, whose seat Van Helmont placed in the upper orifice of the stomach, he admitted several of a subordinate character, which had to execute its orders; one, for instance, in each organ, to preside over its functions; each of them being subject to anger, caprice, terror, and every human feeling.

Some consider, with Mercurialis, that it meant physician to a prince, king, emperor, &c.; others, with C. Hoffmann, apply it to every physician who, by his situation, is raised above his colleagues. The former opinion seems to have prevailed—*Archiatre des Rois de France* being applied to the chief physician to the kings of France.

An instrument so called because first employed to take the specific gravity of fluids lighter than water. The *Areometer* of *Baumé*, which is the most used in Pharmacy, particularly in France, consists of a tube of glass, largely expanded towards its inferior extremity, and terminating below by a small ball, containing mercury or lead, which serves it as a balance, so that it may remain upright in the fluid. This tube is furnished with a graduated scale. If the fluid into which the *Areometer* is plunged be heavier than water, the instrument rises; if lighter, it sinks. There are various *Areometers*, as those of the Dutch, of Fahrenheit, Nicholson, &c. The *Areometer* is also called *Hydrom'eter*, (F.) *Hydromètre*, *Aræomètre*, *Plessiguer*.

There are some hydrometers which have a general application for determining the specific gravities of liquids—as Fahrenheit's, Nicholson's, Guyton de Morveau's, and the common glass hydrometers, including Baumé's, Cartier's, Twaddle's, Zanetti's, and the specific gravity beads; others intended for special application—as for estimating the comparative strength of spirits; the comparative densities of syrups, oils, &c.—as Gay Lussac's, Sikes's, and Dicat's hydrometers, and the saccharometer, urinometer, and elcometer.

ARGEN'TI NI'TRAS, *A. azo'tas*, *Argentum Nitratum* seu *Nitricum*, *Sal argenti*, (F.) *Nitrate ou Azotate d'Argent*, *Nitrate of Silver*. This preparation is sometimes kept in crystals, the *Nitras Argenti in crystal'los concretus*, *Nitrate d'Argent cristallisé* of the Codex of Paris, *Lu'na potab'ilis*, *Crystal'li Lu'ne*, *Argentum nitricum cristallissimum*, *Nitras argen'ti crystal'linus*, *Nitrum luna're*, *Hydrargyrum Boyl'ei*: generally, however, it is in the fused state: and it is this which is admitted

into most Pharmacopœias, and which, besides the name *Argentum Nitratum*, is called *Argentum nitratum fusum* seu *fusa* (Ph. U. S. 1863) seu *fusum*, *Caus'ticum luna're*, *Lapis infernalis*, *Argentum nitricum fusum*, and *lunar caustic*, (F.) *Nitrate d'argent fondu*, *Pierre infernale*. It may be prepared as follows:—Take of *silver*, in small pieces, $\mathfrak{zj}$; *nitric acid*, $\mathfrak{f}\mathfrak{ssij}$, *distilled water*, $\mathfrak{f}\mathfrak{ssij}$. Mix the acid with the water, and dissolve the silver in the mixture in a sand bath; then crystallize, or gradually increase the heat, so that the resulting salt may be dried. Melt this in a crucible over a gentle fire, and continue the heat until ebullition ceases; then immediately pour it into suitable moulds.

The virtues of nitrate of silver are tonic, and escharotic. It is given in chorea, epilepsy, &c.: locally, it is used in various cases as an escharotic. Dose, gr. 1-8 to gr. 1-4 in pill, three times a day.

When silver is combined with iodine, it is said to have the same effect as the nitrate, and not to produce the slate colour of the surface, which is apt to follow the protracted use of the latter.

ARGENTI OXIDUM, see *Argentum*.

ARGENTILLA VULGARIS, *Potentilla anserina*.

ARGENTUM, *Ar'gyrus*, (*αργος*, 'white,') *Sil'ver*, *Lu'na*, *Dia'na*, (F.) *Argentum*. A solid metal of a shining white appearance; insipid; inodorous; highly sonorous; malleable and ductile; somewhat hard; crystallizable in triangular pyramids; fusible a little above a red heat, and volatilizable; s. g. 10.4. Not used in medicine, unless in some places for silvering pills. **SILVER LEAF**, *Argentum foliatum*, is the state in which it is used for this purpose.

The **CHLO'RIDE**, (*Argentum chloridum*, *Argentum muriat'icum* seu *chlorat'um* seu *sali'tum*, *Chloruretum Argenti*, *Chlor'uret* or *Mu'riate of Silver*, (F.) *Chlorure d'Argent*); the **CYAN'URET**; the **I'ODIDE** (*Argentum iodidum*, *Argentum Ioda'tum*, *Ioduretum Argenti*, *Iod'uret of Silver*, (F.) *Iodure d'Argent*); the **OX'IDE** (*Argentum oxidum*, *Argentum oxyda'tum*, (F.) *Oxide d'Argent*), and the **CHLO'RIDE of AMMO'NIA** and **SIL'VER** (*Argentum et Ammonie chloridum*, *Argentum muriat'icum ammoniatum*, *Chloruretum Argenti et Ammonie*, *Chlor'uret of Silver and Ammonia*, *Ammonio-chloride of Silver*, (F.) *Chlorure d'Argent et d'Ammoniaque*), have been used in syphilis. At first, these different preparations were administered intraleptically on the gums; the chloride, the cyanide and the iodide in the dose of 1-12th of a grain; the chloride of silver and ammonia in the dose of 1-14th of a grain, and the oxide of silver, and divided silver, in the dose of 1-8th and 1-4th of a grain. M. Serre, of Montpellier, who made many trials with them, soon found that these doses were too small; he therefore raised that of the chloride to 1-10th, and of the iodide to 1-8th of a grain, without any inconvenience resulting. The dose of the other preparations was likewise increased in a similar ratio. M. Serre extols the preparations of silver—used internally as well as intraleptically—as antisypylitics, but they are not to be depended upon.

The **Cy'anide** or **Cyan'uret**, *Argentum Cyanuretum* seu *Cyan'idum*, *Argentum cyanogena'tum*, (F.) *Cyanure d'argent*, is thus directed to be prepared in the Pharmacopœia of the United States.—*Nitrate of Silver*, dissolved in *distilled water*, is put into a tubulated glass receiver; *Ferrocyanuret of Potassium*, dissolved in *distilled water*, is put into a tubulated retort, previously adapted to the receiver. *Dilute Sulphuric Acid* is added to the solution in the retort; and by means of a sand-bath and a moderate heat, distillation is carried on until the liquid that passes over no longer

produces a precipitate in the receiver. The precipitate is then washed with distilled water, and dried.

Oxide of Silver, Argenti Oxidum, is made by precipitating a solution of the *Nitrate of Silver* by solution of *Potassa*, drying the precipitate. (Ph. U. S.)

ARGENTUM CHLORATUM, see *Argentum*—a. Cyanogenatum, see *Argentum*.

This substance, which is prepared by drying alum and exposing it, for twenty or twenty-five minutes, to a red heat, until the sulphuric acid is driven off, has been recommended in indigestion as antacid, as well as in vomiting and diarrhoea accompanied with acidity. The dose to a very young child is from 3ss to 3j; to older children from 3j to 5ij.

Eight ounces of distilled water are poured on, and, after trituration for a few moments, the whole is transferred to a flask; half a drachm of hydriodic acid, prepared by the acidification of two grains of iodine, is added, and the mixture is boiled for a few moments. When the solution is cold, make the mixture up to f℥viij with distilled water. This is called by Mr. Donovan, the proposer, *Liquor Arsenici et Hydrargyri Iodidi*, each drachm of which, by measure, consists of water, ℥i; arsenious acid, gr. 1-8th; peroxide of mercury, gr. 1-4th; iodine, converted into hydriodic acid, gr. 3-4ths. ARTERIO'TOMY, *Arteriotom'ia*, (*arteria*, and *τομή*, 'I cut.') This word has been used for the dissection of arteries. Most commonly, however, it means a surgical operation, which consists in opening an artery, to draw blood from it. Arteriotomy is chiefly used in inflammatory affections of the head, when the blood is generally obtained from the temporal artery. See Bloodletting.

ARTERIO'TREP'SIS, (*arteria*, and *τρέψις*, 'torsion.') Torsion of an artery with the view of obliterating it.

ARTERITIS, *Arteri'tis*, *Inflammat'io Arteriarum*, (F.) *Artérite*, *Inflammation des artères*, (*arteria* and *itis*.) Inflammation of an artery. Inflammation of the inner coat of an artery is termed *Endo-arteri'tis*, or *Endonarteri'tis*; of the outer, *Ezo-arteri'tis* or *Exarteri'tis*.

ARTERY, *Arte'ria*, (F.) *Artère*, (from *ἀν*, 'air,'

and *ῥησεν*, 'to preserve,' quasi, 'receptacle of air,' because the ancients believed that it contained air. They, at first, gave the name *Artery* to the trachea, *ἀρτηρία τραχεια*, because it is filled with air; and afterwards they used the same term and *ἀρτηρία πνευματική*, *αγγεια πνευματικά*, for the arteries, properly so called, probably because they commonly found them empty in the dead body. We find, also, *φλεβες*, to designate the arteries, called by the Latins *Venæ mican'tes pulsat'iles*.) Arteries, with the moderns, are the order of vessels, which arise from the two ventricles of the heart, and have valves only at their origin. They are cylindrical, firm, and elastic canals; of a yellowish-white colour; little dilatable; easily lacerable; and formed, 1. Of an external laminated, or areolar membrane, *Tu'nica externa* seu *adventi'tia* seu *cellula'ria*, *Vagi'na cellula'ria*, of a dense and close character. 2. Of a middle coat, *Tu'nica me'dia* seu *elasti'ca*, composed of fibres, which do not, however, contract on the application of the galvanic stimulus, formed chiefly of elastic tissue, and also of smooth muscular fibres, and eminently elastic; and, 3. Of an inner coat, *Tu'nica in'tima* seu *gla'bra*, which is thin, diaphanous, reddish, and polished.

The use of the arteries is to carry the blood from the heart to the various parts of the system. It will be obvious, however, that they cannot all convey arterial blood. The pulmonary artery, for example, is destined to convey the *venous* blood to the lungs, there to be converted into arterial; whilst the pulmonary veins convey arterial blood back to the heart.

TABLE OF THE PRINCIPAL ARTERIES OF THE HUMAN BODY.

All the arteries take their rise from the Pulmonary Artery, or the Aorta; and the names generally indicate the parts to which they are distributed.

I. ARTERIA PULMONALIS.

The Pulmonary Artery arises from the right ventricle, and soon divides into a right and left branch, one of which is distributed to each lung.

II. ARTERIA AORTA.

The Aorta arises from the left ventricle. It is the common trunk of the arteries of the body, and may be divided into five portions.

a. Arteries furnished by the Aorta at its origin.

1. A. Cardiaca or coronaria anterior.
2. A. Cardiaca or coronaria posterior.

b. Arteries furnished by the Aorta at its arch.

The arch of the Aorta gives off, to the left, two considerable trunks—the *Arteria carotidea primitiva*, and *A. subclavia*; and, to the right, a single trunk, which is larger—the *A. innominata* or *Brachio-cephalica*, which divides into the *primitiva carotid* and *subclavian*.

Owing to the supply of air being cut off, the unchanged venous blood of the pulmonary artery passes into the minute radicles of the pulmonary veins, but their peculiar excitability requiring arterial blood to excite them, more or less stagnation takes place in the pulmonary capillaries, and death occurs chiefly from this cause, and from the want of arterial blood, and not owing to venous blood being distributed through the system, and 'poisoning' it, as was the idea of Bichat. *Car'us asphyx'ia*, *Mors appa'rens*, *Mors putati'ca*, *Pseudothan'atus*, *Appa'rent death*, *Death trance*, (F.) *Mort appa'rente*, is characterized by suspension or diminution of respiration and circulation, to such a degree as to be scarcely, or not at all, perceptible.

Several varieties of *Asphyxia* have been designated.

1. **ASPHYXIA OF THE NEW-BORN**, *A. neonato'rum*, (F.) *Asphyxie des nouveau-nés*. This is often dependent upon the feeble condition of the infant, or on torpor of the medulla oblongata, not permitting respiration to be established.

2. **ASPHYXIA BY INHALA'TION OF GASES**, some of which cause death by producing a spasmodic closure of the glottis; others by the want of oxygen.

Great difficulty of breathing, recurring at intervals, accompanied with a wheezing sound and sense of constriction in the chest; cough and expectoration. It is a chronic disease, and not curable with facility. There are no pathognomonic physical signs of it. In some cases, the respiration is universally puerile during the attack. In the spasmodic form, the respiratory murmur is very feeble or absent during the fit; and in all forms percussion elicits a clear pulmonary sound. The disease generally consists in some source of irritation, and occasionally, perhaps, in paralysis of the pneumogastric nerves, *Bronchoparal'ysis*, *Paral'ysis ner'vi va'gi in par'te thora'cica*, more frequently of the former—all the phenomena indicating constriction of the smaller bronchial ramifications. The treatment is one that relieves spasmodic action—anæsthetics, narcotics, counter-irritants, change of air, &c.

A disease of infants, characterized by suspension of respiration at intervals; great difficulty of breathing, with *crowing inspiration*, especially on waking, swallowing, or crying; ending often in a fit of suffocation, with convulsions. These symptoms are often accompanied by rigidity of the fingers and toes; the thumb being frequently drawn forcibly into the palm of the clenched hand, whence the name *Car'po-pe'dal spasm*, applied, at times, to the disease.

The pathology of the disease has been supposed to consist in an enlargement of the thymus gland, or of the glands of the neck pressing on the pneumogastric nerves [?]. The ear, by auscultation, at a distance from the chest, detects an incomplete, acute, hissing inspiration, or rather cry; whilst the expiration and voice are croupal, both at the accession and termination of the paroxysm. The heart's action has been observed to be distinct and feeble.

It is much used in chronic rheumatism, herpes, scrofulous diseases, &c. Season, from the 1st of June to the 1st of September.

AUDIT'ION, (*audire*, *auditus*, 'to hear,') *Audit'io*, *Audit'us*, *A'coz*, *Acoz'sis*, *Acu'sis*, (F.) *Ouïe*, Hearing. The act of hearing. The sensation arising from an impression made on the auditory nerves by the vibrations of the air, produced by a sonorous body. The physiology of Audition is obscure. It probably takes place:—

1. By the vibrations being communicated from the *membrana tympani* along the chain of small bones to the membrane of the foramen ovale. 2. By means of the air in the cavity of the tympanum, the membrane of the foramen rotundum is agitated. 3. The transmission may be made by means of the bony parietes. In these three ways the vibrations produced by a sonorous body may reach the auditory nerve. Audition may be *active* or *passive*: hence the difference between *listening* and simply *hearing*.

AUDITORY, *Audit'orius*, *Audit'ivus*, *Acus'ticus*, (F.) *Auditif*. That which relates to audition.

AUDITORY ARTERIES AND VEINS, are vessels which enter the auditory canals, and are, like them, distinguished into *internal* and *external*. The *external auditory artery*, *A. Tympanique*—(Ch.), is given off by the styloid, a branch of the external carotid; the *internal* is a branch of the basilar artery, which accompanies the auditory nerve, and is distributed to it. The *Auditory Veins* empty into the internal and external jugulars.

AUDITORY CANAL, EXTERNAL, *Meatus audit'orius exter'nus*, *Forus acust'icus exter'nus*, *Alveolarium*, *Sca'pha*, *Sca'phus*, (F.) *Conduit auditif externe*, *Conduit auriculaire*, commences at the bottom of the concha, at the *Fora'men auditivum exter'num*, passes inwards, forwards, and a little downwards, and terminates at the *membrana tympani*. It is partly cartilaginous, partly osseous, and partly fibrous.

AUDITORY CANAL, INTERNAL, *Meatus audit'orius inter'nus*, *Forus acust'icus inter'nus*, *Cy'ar*, (F.) *Conduit auditif interne*, *C. labyrinthique*, is situate on the posterior surface of the *pars petrosa* of the temporal bone. From the *Fora'men auditivum inter'num*, where it commences, it passes forwards and outwards, and terminates by a kind of *cul-de-sac*, *mac'ula cribro'sa*, perforated by many holes, one of which is the orifice of the *Aqueductus Fallopii*; and the others communicate with the labyrinth.

AUDITORY NERVE, *Ner'vus audit'orius* seu *acus'ticus*, *Nerf labyrinthique*—(Ch.), is the *Por'tio Mollis* of the seventh pair. It arises from the *corpus restiforme*, from the floor of the fourth

ventricle, and by means of white striæ from the sides of the *calamus scriptorius*. As it leaves the *encephalon*, it forms a flattened cord, and proceeds with the *facial nerve* through the *foramen auditivum internum*, and as far as the bottom of the *meatus*, where it separates from the *facial*, and divides into two branches, one going to the *cochlea*, the *coch'lear*; the other to the *vestibule* and semi-circular canals, the *vestib'ular*.

In *Pathology*, *Aura* means the sensation of a light vapour, which, in some diseases, appears to set out from the trunk or limbs; and to rise towards the head. These two cavities receive the blood from every part of the body. Into the *right auricle*, the two venæ cavæ and coronary vein open; into the *left*, the four pulmonary veins. Chaussier calls the former the *Sinus of the Venæ Cavæ*, *Sinus dexter cordis*; the latter, the *Sinus of the Pulmonary Veins*, *Sinus sinister cordis*. They arise from the temporal artery and are distributed to the meatus auditorius externus, and to the pavilion of the ear. The *posterior auricular* is given off by the external carotid, from which it separates in the substance of the parotid gland. When it reaches the inferior part of the pavilion of the ear it bifurcates; one of its branches being distributed to the inner surface of the pavilion, the other passing over the mastoid process, and being distributed to the temporal and posterior auris muscles, &c. Before its bifurcation it gives off the *stylo-mastoid artery*. The *Anterior and Posterior Auricular Veins* open into the temporal and external jugular.

It ramifies and spreads over the two surfaces of the pavilion. 2. The *auricular or superficial temporal*, *Temporal-cutaneous*—(Ch.), is given off from the inferior maxillary. It ascends between the condyle of the jaw and the meatus auditorius externus, sends numerous filaments to the meatus and pavilion, and divides into two twigs, which accompany the branches of the temporal artery, and are distributed to the integuments of the head. There is also a *posterior auricular* furnished by the facial.

It is slightly colder and moister than that of Madeira, but even more equable. Sir James Clark thinks, that a change from the Azores to Madeira, and thence to Teneriffe—one of the Canaries—would prove more beneficial to the phthisical valetudinarian than a residence during the whole winter in any one of those islands.

BAL'SAM, (*βάλσαμον*.) *Bal'samum*, *Bal'samus*, *Bol'son*, *Bel'son*, (F.) *Baume*. This name is given to natural vegetable substances,—concrete or liquid, but very odorous, bitter, and piquant; composed of resin, benzoic acid, and sometimes of an essential oil,—which allow benzoic acid to be disengaged by the action of heat; readily dissolved in volatile oil, alcohol, and ether; and, when treated with alkalies, afford a soluble benzoate, and throw down resin. We know of five balsams—those of Peru, and Tolu, Benzoin, solid Styra or Storax, and liquid Styra. (See those different words.) There are, however, many pharmaceutical preparations and resinous substances, possessed of a balsamic smell, to which the name *balsam* has been given; but they differ essentially in composition and properties: hence the distinction of balsams into *natural* and *artificial*. The *natural balsams* include the five before mentioned: the *artificial* the remainder.

This word, with the French, is generally used to express the methodical application of rollers, compresses, &c., *Ban'daging*, *Syn'desie*, to fix an apparatus upon any part,—corresponding to the words *deliga'tio*, *fascia'tio*, *fascia'rum applica'tio*, *epid'esie*. With us the noun is usually applied to the result of the application, or to the bandage itself;—a sense in which the French employ the word *Bande*. Bandages are *simple* or *compound*. The simple bandage is *equal*, if the turns are applied circularly above each other; *unequal*, if the turns are not accurately applied upon each other. If each turn of the bandage be only covered one-third, it forms the *doloire* of the French; if the edges touch only slightly, it is the *moussé*; if the turns are very oblique and separated, it is the *spiral*, or *creeping*, (F.) *rampant*; if folded upon each other, it is termed the *reversed*, (F.) *renversé*. By uniting various kinds of bandaging, we have the *compound*; and these compound bandages have received various names expressive of their figure, or of the parts to which they are applied, as *capistrum*, *spica*, &c. Bandages are divided, also, as regards their uses, into *uniting*, *dividing*, *retaining*, *expelling*, *compressing*, &c.

This is again fixed by means of the *scapulary bandage*, which is nothing more than an ordinary bandage, stitched to the anterior and middle part of the napkin, passing over the clavicles and behind the head, to be attached to the back part of the napkin.

It was suggested to the proposer by the relief which the bites of gnats appeared to afford him in an arthritic affection.

It is considered, by some, to be the *Onycha* of the Scriptures, which was burnt as incense.

Two different gum-resins have been in the shops, distinguished by the names *Indian* and *African bdellium*. Dr. Royle was informed that the former was obtained from *Amyris Commiph'ora*, growing in India and Madagascar. The latter is said to be from *Heudelotia Africa'na*, which grows in Senegal.

BEDFORD, MINERAL WATERS OF. Bedford is a village, situate on the great Western Turnpike road from Philadelphia to Pittsburg, a few miles east of the chief elevation of the Alleghany mountains. The "Springs" are about a mile and a half from the village. They are saline and sulphureous. The most celebrated—the "Mineral Spring" or "Anderson's Spring"—contains carbonic acid, sulphate of magnesia, chlorides of sodium and calcium, and carbonate of iron, but none of these articles in great quantity; hence, the main action of the water is diuretic. At some distance from the Springs, there is a chalybeate water; and about 10 miles S. W. of Bedford, at Milliken's Cove, a strong sulphureous spring. The climate of Bedford Springs is agreeable. During the heat of summer, the nights are generally cool. In the morning of July 14, 1853, the author marked the thermometer, at five o'clock, A. M., at 45°. Three days before, however, it was 70° at the same hour.

BEEF TEA, *Jus bovinum*. An infusion of beef, much used in debilitating maladies, and in convalescence. It may be made as follows: Take two pounds and a half of lean beef: cut it, in small pieces, into three parts of water in an earthen pipkin: let this simmer, but never boil, until the liquor is consumed to a pint and a half: then strain carefully. It ought to be entirely free from fat or grease.

Ess'ence of Beef—as it has been called—may be made by putting a pound of good beef, freed from fat, and cut into small pieces, into a porter-bottle, corking lightly. The bottle must be put into boiling water, and kept there until the water has been boiling at least half an hour. As the boiling goes on, the cork may be inserted a little more tightly, to retain the contents of the bottle. The juices

of the beef are thus separated, and constitute the 'essence,' which may be seasoned to the taste. It contains much nutriment.

It consists in debility and tremors of the limbs,—sometimes, indeed, of the whole body; with painful numbness of the affected parts, &c.:—the patient walking doubled, and imitating the movements of sheep (?) Some authors have esteemed it rheumatic; others, paralytic; others, to be a kind of chorea. It is a form of cachexia, in which there is great muscular de-

Pulmonary invalids are occasionally sent to Bermuda, but the principal objection to a winter residence there, is the prevalence of strong winds; especially of the dry, sharp, and cold north-west winds, during the winter and spring. Still, it affords a good winter retreat for the phthisical, from any part of the United States, provided due care be selected in choosing a suitable locality. The neighbourhood of Hamilton has been strongly recommended with this view.

a fluidounce of distilled water with the nitric acid, and dissolve the bismuth in the mixture. BLOOD, (Sax. blōd, from blēan, 'to bleed,')

Sanguis, *Cru'or*, *La'pis animat'is*, *Hæ'ma*, (Old Eng.) *Blede*, (F.) *Sang*. An animal fluid formed chiefly from the chyle; acquiring important properties during respiration; entering every organ through the circulation; distributing the nutritive principles to every texture, and the source of every secretion. The blood is white in the molluscous and inferior animals, which have been, hence, called *white-blooded*, to distinguish them from the *red-blooded*, which class includes the mammalia, birds, reptiles, and fishes. Human blood is composed of water, albumen, fibrin, an animal colouring substance, a little fatty matter—*hæmatelæum*—and different salts; as chlorides of potassium and sodium, phosphate of lime, subcarbonate of soda, lime, magnesia, oxide of iron, and lactate of soda, united with an animal matter. *Arterial blood* is of a florid red colour, strong smell; s. g. 1.049. *Venous blood* is of a brownish red; s. g. 1.051. The difference in colour has given occasion to the first being called *red blood*; the latter, *black*. The former, which is distributed from the heart, is nearly the same through its whole extent: the latter is the remains of the arterial blood after the different elements have been taken from it in nutrition, with the addition of the products of absorption. Blood, taken from a vessel and left to itself, becomes solid, and separates into two distinct parts,—the *serum* or watery supernatant

fluid; and the *cruur*, *coagulum*, *crassamentum*, *hepar seu placenta sanguinis*, *placenta cruoris*, *insula*, *thrombus*, or clot. The serum is chiefly water holding albumen in solution and the salts of the blood. The clot contains the fibrin, colouring matter—*hematosin*, a little serum, and a small quantity of salts. M. Le Canu found the blood to be composed—in 1000 parts—of water, 785.590; albumen, 69.415; fibrin, 3.565; colouring matter, 119.626; crystallisable fatty matter, 4.300; oily matter, 2.270; extractive matter soluble in alcohol and water, 1.920; albumen combined with soda, 2.010; chlorides of sodium and potassium; alkaline phosphates, sulphates, and subcarbonates, 7.304; subcarbonate of lime and magnesia, phosphate of lime, magnesia and iron, peroxide of iron, 1.414; loss, 2.586. The four principal components of the blood are fibrin, albumen, corpuscles, and saline matter. In the circulating blood they are thus combined—

Fibrin, }
Albumen, } In solution forming *Liquor Sanguinis*.
Salts, }

Red and white Corpuscles, suspended in the *Liquor Sanguinis*.

In coagulated blood they are thus combined :

Fibrin, } Forming the *crassa-*
Red and white Corpuscles, } *mentum* or clot.
Albumen, } Remaining in solution, forming
Salts, } *serum*.

The estimates of Günther, Bock, and Blake are probably approximations to the truth.

The proportion of arterial blood to venous is about 4 to 9.

Much attention has been paid to the varying condition of the blood in disease. The average proportion of each of the organic elements in 1000 parts of healthy blood is as follows, according to Le Canu, and MM. Andral and Gavarret :—fibrin, 3; red corpuscles, 127; solid matter of the serum, 80; water, 790.

Dried human blood was, at one time, considered to be anti-epileptic; that of the goat, dried, *Sanguis hirci siccat'us*, sudorific and antipleuritic. The dried blood of the ox—*Extractum Sanguinis Bovini*—and the dried red corpuscles have been given as analeptics, especially where there was a deficiency of red corpuscles.

A discharge of a certain quantity of blood produced by art: an operation which consists in making an opening into a vessel to draw or let blood from it. When practiced on an artery, it is called *Arteriot'omy*; on a vein, *Phlebot'omy*, *Venæsec'tio*, *Venesection*, *Breath'ing a vein*, and on the capillary vessels, *local or capillary*, in contradistinction to the former, which is termed *general*. Bloodletting is used both during the existence of a disease, as in inflammation, and in the way of prophylaxis. It is employed to fulfil various indications. 1. To diminish the actual mass of blood;—when it is termed, by the French pathologists, *Saignée évacuative*. In such case, fluids ought not to be allowed too freely afterwards. 2. To diminish the turgescence in any particular organ—(F.) *Saignée révulsive*, *Revulsive bloodletting or bleeding*, *Venæsec'tio revulsoria*, when performed far from the part affected; and *Saignée dérivative*, when near. 3. To diminish the corpuscles of the blood, (F.) *Saignée spoliative*, *Spoliative Phlebot'omy*. The immediate effects of blood-letting are: diminution of the mass of blood and of heat; retardation of the pulse, and sometimes syncope. Bloodletting from the veins—*phlebotomy*—is practised on the subcutaneous veins of the neck, the face, the fore-arm, and the leg; sometimes on those of the hand or foot. The necessary apparatus consists of a bandage or riband, a compress of rag, and a lancet or fleam.

The veins selected for the operation, are, 1. *In the fold of the arm*, five;—the cephalic, basilic, the two median, and the anterior cubital. 2. *In the hand*, the cephalic and salivata. 3. *In the foot*, the great and little saphena. 4. *In the neck*, the external jugular. 5. *In the forehead*, the frontal. 6. *In the mouth*, the ranine. The operation of phlebotomy in the limbs is performed by tying a circular bandage round the limb, in order that the subcutaneous veins may become turgid by the course of the blood being obstructed: the bandage not being so tight, however, as to compress the arteries of the limb. A puncture is made into the vein, and the desired quantity allowed to flow. The ligature is now removed, and a compress and retaining bandage applied. *Capillary or local bloodletting*, *arterio-phlebot'omy*, is practised on the skin or mucous membranes, by means of leeches, the lancet, or cupping.

Until of late, this office was executed in England by two old women—called 'searchers'; and hence the imperfections of the Bills of Mortality. In plague times, the office was an important one; and, it is stated, that a noted searcher, named Snacks, finding his business increase so much, that he could not transact it alone, offered to any one who would join him in its hazards, half the profits; and they who joined him were said to "go with Snacks." Os. The bones are the solid and hard parts,

which form the basis of the bodies of animals of

the superior classes; and the union of which con-

stitutes the skeleton. The human body has, at

the adult age, 240 bones, including the 32 teeth,

the ossa Wormiana, and excluding sesamoid

bones. Anatomists divide them, from their shape,

into 1. *Long bones*, which form part of the

limbs, and represent columns for supporting the

weight of the body, or levers of different kinds

for the muscles to act upon. 2. *Flat bones*, which

form the parietes of splanchnic cavities; and, 3.

Short bones, met with in parts of the body where

solidity and some mobility are necessary. Bones

are formed of two different textures; *spong'y*,

Substan'tia spongio'sa; and *compact'*, *Substan'tia*

compac'ta. They afford, on analysis, much phos-

phate and carbonate of lime, a little phosphate

of magnesia, phosphate of ammonia, oxide of

iron and manganese, some traces of alumina and

silica, gelatin, fat, and water. The uses of the

bones are mentioned under each bone. They

give shape to the body, contain and defend the

viscera, and act as levers to the muscles.

The bones of the ox, *Bos Tau'rus*, are employed

in pharmacy.

Accordingly, it is adapted for all cases in which a dry and mild air at this season of the year proves beneficial. It is well adapted for convalescents, and for all who require a dry and bracing sea air.

BRON'CHIA, pl. of *bronchion*, (*βρογχια*,) *Bron'-chix*, *Bron'chi*. The Latins used the term *Bron-chus* for the whole of the trachea; whilst they called its ramifications *Bronchia*. *Bronchia*, *Bronchia*, and *Bronchi*, (F.) *Bronches*, now mean the two tubes, with their ramifications, which arise from the bifurcation of the trachea, and carry air into the lungs—*Can'nula pulmo'num*, *Syrin'ges* seu *Can'a'les aërif'eri*.

BRONCHIA, DILATA'TION OF THE, *Dilata'ted Bron'-chia*, *Bronche'ctasis*, *Bronchie'ctasis*, *Dilata'tio bronchio'rum*. The physical signs of this condi-tion are the following: *Percussion* usually clear, but not unfrequently less so than natural, although very seldom quite dull. *Auscultation* detects coarse mucous or gurgling rhonchi, increased by the cough, combined with, or replaced by, bronchial or cavernous respiration, which is often effected as if by a sudden puff or whiff. The resonance of the voice is increased, but it seldom amounts to perfect pectoriloquy. The most common situa-tions for dilated bronchia are the scapular, mam-mary, and lateral regions. They are almost always confined to one side.

BRONCHIA, OBLITERA'TION OR COMPRES'SION OF THE. The inspiratory murmur on auscultation is weaker or wholly suppressed over a limited por-tion of the chest; the expiration is generally more distinct and prolonged: all the other conditions are natural.

Their functions are unknown. The bronchial glands may be presumed to be affected by scro-fulosis, when, in addition to the existence of tumours in the neck, percussion gives a dull sound under the upper and central part of the sternum, whilst there is no appreciable lesion of the lungs.

BRONCHIAL NERVES, (F.) *Nerfs bronchiques*, are furnished by the two pulmonary plexuses.

Inflammation of the lining membrane of the bronchial tubes. This is always more or less present in cases of pulmonary catarrh; and is accompanied by cough, mucous expectoration, dyspnoea, and more or less uneasiness in breathing. The acute form is accompanied with all the signs of internal inflammation, and requires the employment of antiphlogistics followed by revulsives. The chronic form, *Tus'sis seni'lis*, *Catar'rus seni'lis*, *Rheu'ma catarrha'le*, *Peripneumo'nia no'tha*, *Bronchorrha'a acu'ta*, *Win'ter Cough*, *Chronic Catarrh'*, may be confounded with phtthisis; from which it must be distinguished mainly by the absence of hectic fever and of the physical signs that are characteristic of the latter, as well as by the nature of the expectoration, which is generally mucous, although at times muco-purulent. When the expectoration is little or none, the bronchitis is said to be *dry*; *dry catarrh*, (F.) *Catarrhe Sec*; when fetid, the disease is termed *fetid bronchitis*.

This is no rupture, but consists of an enlargement of the thyroid gland. It is common at the base of lofty mountains in every part of the world; and has been supposed to be owing to the drinking of snow-water, but it occurs where there is no snow. The tumour is sometimes very extensive. Iodine has great power over it, and will generally occasion its absorption, when the case has not been of such duration as to have ended in a cartilaginous condition. Shakspeare describes the tumors as 'wallets of flesh.'—Gonzalo, in *Tempest*, Act III. Scene 3.

A high degree of *Bruit de soufflet*, heard on auscultating the arteries or veins—probably the latter—of the neck, in chlorosis. It denotes an impoverished state of the blood.

They are distinctly heard in pleuritis, when the pleura has become roughened by the disease. *Friction sounds*, *Rub'ing sounds*, *To-and-fro sounds* are also heard in pericarditis and peritonitis.

BRUIT MUSCULAIRE, ('muscular sound,') The sound accompanying the first sound of the heart, referred by some to muscular contraction. Called, also, *Bruit rotatoire*, in consequence of its having been thought to resemble the rumbling of distant wheels.

The bellows' sound heard on auscultating over the site of the placenta in a pregnant female. It does not appear to be owing to the placental vessels, but to the uterine tumor pressing upon the large vessels of the mother.

BRUIT DE POT FÉLÉ, ('sound of a cracked vessel,') *Cracked pot sound*. A sound heard on percussion, when a cavern in the lungs is filled

with air, and has a narrow outlet. It is not diagnostic, however.

BRUIT DE RÂPE, ('sound of a rasp.') A sound heard during the contraction of either the auricles or ventricles. It is constant; and the contraction of the cavity is more prolonged than natural, and emits a hard, rough, and—as it were—stifled sound.

It indicates contraction of the valvular orifices by cartilaginous deposits, or ossification, and is better heard near the apex of the heart, if the auriculo-ventricular valves are concerned,—near the base, if the semilunar valves are the seat of the disease.

BRUIT RESPIRATOIRE, Murmur, respiratory.

BRUIT ROTATOIRE, *Bruit musculaire*—*b. de Rouet*, ('sound of the spinning-wheel,') see *Sifflement modulé*.

BRUIT DE SCIE, ('saw sound,') and **BRUIT DE LIME À BOIS**, ('file sound,') resemble the *Bruit de Râpe*.

BRUIT DE SOUFFLET, *Bruit de Souffle*, ('bellows' sound, 'blowing sound,') *Physèche ma*. A sound like that of a bellows, heard occasionally by the ear applied to the chest during the contraction of the ventricles, auricles, or large arteries. It coexists with affections of the heart, but is heard, also, without any disease of that organ,—whenever, indeed, an artery is compressed. An *Encephalic bellows' sound*, (F.) *Bruit de souffle céphalique*, has been described by Drs. Fisher and Whitney. It is heard on applying the ear to the occiput or to the top of the head; and is considered to indicate turgescence of vessels, or inflammation. When such turgescence exists, the vessels are compressed, and the compression gives rise to the sound in question.

BRUIT DE SOUPAPE, ('valvular or flapping sound,') A sound heard in respiration, when a foreign body is in the air passages. It somewhat resembles the flapping of a valve; hence its French name.

BRUIT DE TAFFETAS, ('sound of taffeta, sarcenet sound,') A respiratory sound, so named, by M. Grisolle, from its resembling the sound caused by the tearing of a piece of taffeta; and which he considers to indicate hepatization of the lung, limited to the surface, in pneumonia.

Ord. Umbelliferae. The plant which affords the galbanum can scarcely, however, be considered to be determined. By the Dublin College, it was referred to *Opo'dia Galbanif'era*, Ord. Umbelliferae. Galbanum, *Chal'bané*, is a gummiferous juice. Its odour is fetid, and taste bitter and acrid: the agglutinated tears are of a white colour, on a ground of reddish-brown. It forms an emulsion when triturated with water, and is soluble in proof spirits of wine, and vinegar: sp. gr. 1.212. It has been given as an anti-spasmodic and expectorant, in pill or emulsion. Dose, from gr. 10 to 60. Externally, it is applied as a cataplasm.

Bubon galbanum is a South African plant; and is reputed to be an excellent diuretic, under the name of *Wild Cel'ery*. A decoction of the leaves is given in dropsy and gravel. According to Pappé, the resinous matter, which exudes from the stem, differs in appearance, smell, and in every respect, from *Gummi Galbanum*.

Some surgeons have confined this term to hernia when limited to the groin, and have called the same affection, when it has descended to the scrotum, *Oscocoe'lē*, *Scrotal Her'nia*. The rupture passes through the abdominal ring: and, in consequence of the greater size of the opening in the male, it is more frequent in the male sex.

CALCULI, pl. of Calculus, (dim. of *calx*, 'a stone,') *Lithi*, *Lap'ides*, (F.) *Calculus*, *Pierres*. Calculi are concretions which may form in every part of the animal body, but are most frequently found in the organs that act as reservoirs, and in the excretory canals. They are met with in the tonsils, joints, biliary ducts, digestive passages, lachrymal ducts, mammae, pancreas, pineal gland, prostate, lungs, mammary, spermatic and urinary passages, and in the uterus. The causes which give rise to them are obscure.

Those that occur in reservoirs or ducts are supposed to be owing to the deposition of the substances, which compose them, from the fluid as it passes along the duct; and those which occur in the substance of an organ are regarded as the product of some nutritive irritation. Their general effect is to irritate, as extraneous bodies, the parts with which they are in contact; and to produce retention of the fluid, whence they have been formed. The symptoms differ, according to the sensibility of the organ and the importance of the particular secretion whose discharge they impede. Their solution is generally impracticable: spontaneous expulsion or extraction is the only way of getting rid of them.

CALCULI ALTERNATING, see Calculi, urinary—c. Articular, see Calculi, arthritic, and Concretions, articular.

CALCULI ARTHRITIC, *To'phi, Tubercula arthritica, Calculi arthritici seu podagrici, Chalk-stones, Gout-stones, Nodes*, (F.) *Pierres crayeuses, Calculi arthritiques, Nœuds*. Concretions, which form in the ligaments, and within the capsules of the joints, in persons affected with gout. They are composed of uric acid, soda, and a little animal matter; very rarely, urate of lime and chloride of sodium are met with. Similar calculi are found in other parts besides the joints.

CALCULI BILIARY, *Calculi biliosi seu fellii seu biliarum, Chololithus, Cholelithus, Biliary Concretions, Gall-stones*, (F.) *Calculi biliaries, Pierres au fiel, Angichololithes of Piorry*. Some of these contain all the materials of the bile, and seem to be nothing more than that secretion thickened. The greater part are composed of from 88 to 94 parts of *Cholesterolin*, and of from 6 to 12 of the yellow matter of the bile. Biliary calculi are most frequently found in the gall-bladder: at other times, in the substance of the liver, in the branches of the *Ductus hepaticus*, or in the *Ductus Communis Choledochus*. The first are called *Cystic*; the second *Hepatic*: and the last, sometimes, *Hepatocystic*. The causes which give rise to them are very obscure. When quiescent they often occasion no uneasiness. At times, they are rejected by the mouth, or by the bowels, along with a considerable quantity of bile, which had accumulated behind them; at other times they occasion violent abdominal inflammation, abscesses, and biliary fistulæ, rupture of the gall-bladder, and fatal effusion into the peritoneum. The passage of a gall-stone is extremely painful; yet the pulse is not at first affected. Antiphlogistics, when there is inflammatory action, and anæsthetics, and strong doses of opium, to allay the pain and spasm, with the warm bath, are the chief remedies. Solvents are not to be depended upon. They cannot reach the calculi.

CALCULI, BONE EARTH, see Calculi, urinary—c. Compound, see Calculi, urinary—c. Cystic, see Calculi, urinary.

CALCULI OF THE EARS, (F.) *Calculi de l'Oreille*. Hard, light, and inflammable concretions, which occur in the *meatus auditorius externus*, and are merely indurated cerumen. They are a frequent cause of deafness. They can be easily seen, and may be extracted by appropriate forceps, after having been softened by injections of soap and water.

CALCULI FELLEI, Calculi, biliary—c. Fusible, see Calculi, urinary.

CALCULI, LACHRYMAL, (F.) *Calculi lacrymanx*. Concretions sometimes, but rarely, form in the lachrymal passages, where they occasion abscess and fistulæ, which do not heal until they are extracted.

CALCULI, LITHIC, see Calculi, urinary.

CALCULI OF THE MAMMÆ, (F.) *Calculi des Mamelles*. Haller gives a case of a concretion, of a yellowish white colour, which had the shape

of one of the excretory ducts of the mammary gland, having been extracted from an abscess seated in that organ.

CALCULI, MULBERRY, see Calculi, urinary.

CALCULI OF THE PANCREAS, (F.) *Calculi du Pancreas*. These are but little known. Analogy has induced a belief that they resemble the salivary. Some have supposed that certain transparent calculi, rejected by vomiting, or passed in the evacuations, have proceeded from the pancreas, but there seems to be no sufficient reason for this belief.

CALCULI OF THE PINÆAL GLAND, (F.) *Calculi de la Glande Pinéale*. Sabulous concretion are usual in the gland. No phenomena announce their presence during life. They are composed of phosphate of lime.

CALCULI PODAGRICI, Calculi, arthritic.

CALCULI OF THE PROSTATE, *Prostatic calculi*. These are not very rare. They have generally the same composition as the preceding. They usually present the symptoms common to every tumefaction of the prostate, and sometimes those of calculi in the bladder.

CALCULI PULMONARY, (F.) *Calculi pulmonaires*. These concretions are very frequently met with in the dead body, without seeming to have produced unpleasant symptoms during life. At other times, they are accompanied with all the symptoms of phthisis, *Lithophthiësis, Phthiësis calculeuse*, of Bayle. See *Lithiasis pulmonum*. At times they are expectorated without the supervention of any unpleasant symptom. They are usually formed mainly of carbonate of lime and animal matter.

CALCULI, SALIVARY, *Calculi Salivales, Sialolithi*, (F.) *Calculi salivares*. Concretions, usually formed of phosphate and carbonate of lime and animal matter, which are developed in the substance of the salivary glands or in their excretory ducts. In the first case, they may be mistaken for a simple swelling of the gland; in the second, they may generally be detected by the touch. They may be extracted by incision in the interior of the mouth. The calculus developed in the sublingual ducts has been called *Calculus sublingualis* and *Ranula lapidea*.

CALCULI, SPERMATIC, (F.) *Calculi spermaticus*. These have been sometimes found in the vesiculæ seminales after death. They cannot be detected during life.

CALCULI OF THE STOMACH AND INTESTINES, *Enterolithus, E. Calculus, Coprolithus, Concretiones alvinae*, (F.) *Calculi de Estomac, C. intestinaux ou stercoraux, Pierres stercorales, Concretions intestinales*. Calculi of the stomach are rare, and have almost always been carried thither by the antiperistaltic action of the intestines. The symptoms occasioned by them are those of chronic gastritis. It has been imagined that the continued use of absorbent powders, as magnesia, will give occasion to them.

Intestinal concretions, (F.) *Calculi intestinaux*, are not uncommon in animals (see BEZOARD): but they are rare in man. The causes which give rise to them are little known: sometimes a biliary calculus affords them a nucleus. Their composition varies. They are light, hard, very fetid, and are formed, ordinarily, between the valvule of the small intestines, or in the cells of the large, and sometimes in old herniæ. Whilst they do not obstruct the passage of the alimentary mass, they produce no unpleasant symptoms. At times, the movable tumour which they form may be felt through the parietes of the abdomen. They are generally evacuated *per anum*.

CALCULI OF THE TONSILS, *Calculeus* concretions, which sometimes form in the tonsils. (F.) *Calculi des Amygdales*. They are easily recognised by the sight and touch: sometimes they

are discharged by spitting, either alone or with the pus of an abscess occasioned by their presence.

CALCULI, TRIPLE, see Calculi, urinary—c. Uric, see Calculi, urinary.

CALCULI, URINARY, *Urolithi*, (F.) *Calculus urinarius*, *Pierres urinaires*. Concretions which form from the crystallizable substances in the urine, and are met with not only in the whole course of the urinary passages, but in fistulous openings wherever the urine stagnates naturally or accidentally. Their causes are but little known. They are more common at the two extremities of life than at the middle, and more so in some countries and districts than in others.

At times, a clot of blood, a portion of mucus, &c., form the nucleus. The symptoms and treatment vary according to the seat of the calculus. There is no such thing, probably, as a medical solvent. See Urinary Calculi.

Chymists have demonstrated the existence of several components of urinary calculi, viz., *Lithic Acid* and *lithates*, *Phosphate of Lime*, *Ammoniac-Magnesian Phosphate*, *Oxalate of Lime*, *Cystic Oxide*, and *Xanthic Oxide*, with an animal cementing ingredient. The varieties of calculi, produced by the combination or intermixture of these ingredients, were thus represented by Dr. Paris.

A TABULAR VIEW OF DIFFERENT SPECIES OF URINARY CALCULI.

SPECIES OF CALCULI.	EXTERNAL CHARACTERS.	CHYMICAL COMPOSITION.	REMARKS.
1. LITHIC OR URIC.	Form, a flattened oval. S. G. generally exceeds 1.500. Colour, brownish or fawn-like. Surface, smooth. Texture, laminated.	It consists principally of <i>Lithic Acid</i> . When treated with nitric acid, a beautiful pink substance results. This calculus is slightly soluble in water, abundantly so in the pure alkalies.	It is the prevailing species; but the surface sometimes occurs finely tuberculated. It frequently constitutes the nuclei of the other species.
2. MULBERRY, (F.) <i>Calculus murax.</i>	Colour, dark brown. Texture, harder than that of the other species. S. G. from 1.428 to 1.976. Surface, studded with tubercles.	It is <i>oxalate of lime</i> , and is decomposed in the flame of a spirit lamp swelling out into a white efflorescence, which is <i>quicklime</i> .	This species includes some varieties, which are remarkably smooth and pale-coloured, resembling <i>hempseed</i> .
3. BONE EARTH.	Colour, pale brown or gray; surface, smooth and polished; structure, regularly laminated; the laminae easily separating into concrete crusts.	Principally <i>phosphate of lime</i> . It is soluble in muriatic acid.	
4. TRIPLE.	Colour, generally brilliant white. Surface, uneven, studded with shining crystals, less compact than the preceding species. Between its laminae small cells occur, filled with sparkling particles.	It is an <i>ammoniac-magnesian phosphate</i> , generally mixed with phosphate of lime. Pure alkalies decompose it, extracting its ammonia.	This species attains a larger size than any of the others.
5. FUSIBLE.	Colour, grayish white.	A compound of the two foregoing species.	It is very fusible, melting into a vitreous globule.
6. CYSTIC.	Very like the triple calculus, but it is unstratified and more compact and homogeneous.	It consists of <i>cystic oxide</i> . Under the blowpipe it yields a peculiarly fetid odour. It is soluble in acids, and in alkalies, even if they are fully saturated with carbonic acid.	It is a rare species.
7. ALTERNATING.	Its section exhibits different concentric laminae.	Compounded of several species, alternating with each other.	
8. COMPOUND.	No characteristic form.	The ingredients are separable only by chymical analysis.	

1. *Renal Calculi*, (F.) *Calculus rénax*. These have almost always a very irregular shape: at times, there is no indication of their presence: at others, they occasion attacks of pain in the kidneys, sometimes accompanied by bloody or turbid urine. Often, they cause inflammation of the kidneys, with all its unpleasant results. They are generally formed of uric acid, or oxalate of lime, and at times, phosphates with animal matter. The treatment will have to vary, according to the presumed constituents and to the absence or presence of inflammatory signs,—relieving the irritation by opiates. A surgical operation can rarely be applicable.

2. *Calculi of the Ureters*, (F.) *Calculus des Urètres*. These come from the kidneys, and do not produce unpleasant effects, unless they are so large as to obstruct the course of the urine, and to occasion distension of the whole of the ureters above them; or unless their surface is so rough as to irritate the mucous membrane, and occasion pain, hemorrhage, abscesses, &c. The pain, during the passage, is very violent, extend-

ing, at times, to the testicles of the same side in the male; and occasioning a numbness of the thigh in both sexes. The treatment consists in general or local blood-letting, warm bath, and opiates.

3. *Vesical Calculi*; *Stone in the Bladder*, *Lith'ia vesical'is*, *Lith'iasis cystica* seu *vesical'is*, *Cystolith'iasis*, *Dysu'ria calculosa* seu *irritata*, *Calculus vesicæ*, (F.) *Calculus vésicaux*. These are the most common. Sometimes, they proceed from the kidneys: most commonly, they are formed in the bladder itself. Sense of weight in the perinaeum, and sometimes of a body rolling when the patient changes his position; pain or itching at the extremity of the glans in men; frequent desire to pass the urine; sudden stoppage to its flow; and bloody urine—are the chief phenomena, that induce a suspicion of their existence. We cannot, however, be certain of this without sounding the patient. Sometimes, when of a small size, they are expelled: most commonly, they remain in the bladder, the disorganization of which they occasion, unless removed by a surgical operation.

4. *Urethral Calculi*. These almost always proceed from the bladder. The obstruction, which they cause to the passage of the urine, the hard tumour, and the noise occasioned when struck by a sound, indicate their presence. They are removed by incision. They form, at times, in the prostate gland, *Prostatolithi*.

5. *Calculi of Fistulous Passages*. These arise when there is some fistulous opening into the urethra. They can be readily recognised, and may generally be extracted with facility. (F.) *Calculs placés hors des voies urinaires*. See Urinary Calculi.

CALCULI OF THE UTERUS, (F.) *Calculs de l'Utérus*. These are very rare. The signs, which indicate them during life, are those of chronic engorgement of the uterus. Their existence, consequently, cannot be proved till after death.

This texture is met with, principally, at the extremities of long bones; and some of the short bones consist almost wholly of it. It allows of the expansion of the extremities of bones,

without adding to their weight, and deadens concussions.

CAN'CER, gen. *Canceri*, 'a crab.' *Car'cinus*, *Lu'pus Cancro'sus*. A disease, so called either on account of the hideous appearance which the ulcerated cancer presents, or on account of the great veins which surround it, and which the ancients compared to the claws of the crab: called also *Carcino'ma*. It generally consists of a scirrhus, livid tumour, intersected by firm,

whitish, divergent bands; and occurs chiefly in the secretory glands. The pains are acute and lancinating, and often extend to other parts. The tumour, ultimately, terminates in a fetid and ichorous ulcer, — *Ulcus cancro'sum*. It is distinguished, according to its stages, into *occul't*, *Can'cer occul'tus*, and *o'pen*, *C. aper'tus*; the former being the scirrhus, the latter the ulcerated condition. At times, there is a simple destruction or erosion of the organ, at others, an *enceph'aloid* or *cer'ebriform*, and at others, again, a *colloid* degeneration.

For its production, it requires a peculiar diathesis, or cachexia. The following table, from

ENCEPHALOID.	SCIRRHUS.	COLLOID.
Resembles lobulated cerebral matter. Is commonly opaque from its earliest formation. Is of a dead white colour. Contains a multitude of minute vessels. Is less hard and dense than scirrhus. Is frequently found in the veins issuing from the diseased mass. The predominant microscopical elements are globular, not always distinctly cellular, and caudate corpuscula. Occasionally attains an enormous bulk. Has been observed in almost every tissue of the body. Very commonly co-exists in several parts or organs of the same subject. Is remarkable for its occasional vast rapidity of growth. Is frequently the seat of interstitial hemorrhage and deposition of black or bistre-coloured matter. When softened into a pulp, appears as a dead white or pink opaque matter of creamy consistence. Subcutaneous tumours are slow to contract adhesion with the skin. Ulcerated encephaloid is frequently the seat of hemorrhage, followed by rapid fungous development. The progress of the disease after ulceration is commonly very rapid. It is the most common form under which secondary cancer exhibits itself. Is the species of cancer most frequently observed in young subjects.	Resembles rind of bacon traversed by cellulo-fibrous septa. Has a semi-transparent glossiness. Has a clear whitish or bluish yellow tint. Is comparatively ill-supplied with vessels. Is exceedingly firm and dense. Has not been distinctly detected in this situation. The main microscopical constituents are juxtaposed nuclear cells; caudate corpuscula do not exist in it. Rarely acquires larger dimensions than an orange. Its seat, as ascertained by observation, is somewhat more limited. Is not unusually solitary. Ordinarily grows slowly. Is comparatively rarely the seat of these changes. Resembles, when softened, a yellowish brown semitransparent gelatinous matter. Scirrhus thus situate usually becomes adherent. Scirrhus ulcers much less frequently give rise to hemorrhage; and fungous growths (provided they retain the scirrhus character) are now more slowly and less abundantly developed. There is no such a remarkable change in the rate of progress of the disease after ulceration has set in. Is much less common before puberty.	Has the appearance of particles of jelly inlaid in a regular alveolar bed. The contained matter is strikingly transparent. Greenish yellow is its predominant hue. Its vessels have not been sufficiently examined as yet. The jelly-like matter is exceedingly soft; a colloid mass is, however, firm and resisting. The pulsatious variety has been detected in the veins. Is composed of shells in a state of <i>emboîtement</i> . Observes a mean in this respect. Has so far been seen in a limited number of parts only. Has rarely been met with in more than one organ. Grows with a medium degree of rapidity. Undergoes no visible change of the kind. Has so far been observed in adults only.

Dr. Walshe, exhibits the characters of the three great species of cancer.

The use of irritants in cancerous affections is strongly to be deprecated. When the disease is so situate that excision can be practised, and the constitution does not exhibit great contamination, the sooner it is removed the better. See Carcinoma, and *Thn'doblaste*.

labio'rum et gena'rum, (F.) *Cancer aquatique*, *Stomatite gangréneuse*, *S. Charbonneuse*, *Gan'grène ou Sphacèle de la Bouche*, *Fégurite*, *Aph'the gangréneuse*. Certain sloughing or gangrenous ulcers of the mouth—so called, perhaps, because they are often accompanied with an afflux of saliva. The disease is not uncommon in children's asylums, and demands the same treatment as hospital gangrene,—the employment of caustics, and internal and external antiseptics.

It is much employed in *medicine*, and is the most common vesicatory. Given internally, and even when absorbed from the skin, it affects the urinary organs, exciting stranguy. This may be prevented, in cases of blisters, by interposing between the blistering plaster and skin a piece of tissue paper. Diluents relieve the stranguy. Dose, half a grain to one grain. If kept dry, the flies will retain their activity for many years. Their active principle—*Can'tharidin*, *Cantharidin'na*—has been separated from them.

CARBO. gen. *Carbo'nis*, Carbon, (F.) *Carbone*. An elementary body, extensively distributed in nature, and one of the principal elements of organized bodies. It occurs in different conditions; and the two following forms are official in the Pharmacopœia of the United States. Also, a live coal; charcoal; and anthrax.

CARBO ANIMA'LIS. *C. carnis*, *An'imal char'coal*, (F.) *Charbon animal*, is usually prepared by subjecting bones to a red heat in close vessels. The result is *Bone black*, commonly called *P'erry black*. (F.) *Noir animal ou d'Os*. It is given in the same cases as *Carbo Ligni*, and has been extolled in cancer. Dose, gr. ss to gr. iij.

The Ph. U. S. contains a formula for the preparation of *CARBO ANIMA'LIS PURIFICA'TUS*, *Purified an'imal char'coal* (*Carbon. animal. lbj*; *Acid muriat.*, *Aquæ aa* f 3xij). The muriatic acid, previously mixed with the water, is digested with a gentle heat for two days. The undissolved portion is allowed to subside, the supernatant liquor is poured off, and the charcoal, frequently washed with water until it is entirely free from acid, is dried.

CARBO FOS'SILIS. *Lithan'thrax*, Stone coal.

CARBO HUMA'NUM. The human excrement.—*Paracelsus*.

CARBO LIG'NI. *Charcoal*, (F.) *Charbon*. Fresh charcoal is antiseptic. It is used to improve the digestive organs in cases of worms, dyspepsia, &c.; as a cataplasm to gangrenous and fetid ulcers, tinea, &c., and forms a good tooth-powder. Dose, gr. x to ʒi.

It is often found occupying the lower parts of mines—when it is called the *choke damp*—caverns, tombs, wells, brewers' vats, &c., and not unfrequently has been the cause of death. Lime thrown into such places soon absorbs the acid.

It is positively deleterious, and is often the cause of injurious phenomena, which have been ascribed to the inhalation of carbonic acid. This is made by mixing concentrated alcoholic solutions of iodine and potassa, until the former loses its colour; a solution is obtained from which water throws down a yellow precipitate—the sesqui-iodide of carbon. It has been used in enlarged glands and in some cutaneous affections, applied externally, (3ss to ʒvj of cerate). See Iodoform.

It is diaphoretic, diuretic, and is said to have proved emmenagogue. It is also used in nervous diseases as an antispasmodic. Dose, one drop to four, repeated frequently.

It is used externally, where a cooling influence has to be rapidly exerted, and has been inhaled as an anæsthetic.

The disease commonly occurs between the third and ninth month, and is characterized by excessive dyspnoea, accompanied by a loud croupy noise on inspiration; the thumbs being locked, and the hands and feet rigidly bent for a longer or shorter period. The seat of the disease is evidently in the cerebro-spinal axis, primarily or secondarily: generally, perhaps, it is owing to erethism seated elsewhere, but communicated to the cerebro-spinal centre, and reflected to the respiratory and other muscles concerned. It seems to be connected with dental irritation; and consequently, in the treatment, where such is the case, the gums should be freely divided; after which, cathartics and revulsives, with the use of narcotics and appropriate diet, will generally remove the affection; for although extremely alarming, it is often not attended with great danger. A deprivation of sight, which comes on as if a veil fell before the eyes. Cataract consists in opacity of the crystalline lens or its capsule, which prevents the passage of the rays of light, and precludes vision. The causes are obscure. *Diagnosis*.—The patient is blind, the pupil seems closed by an opaque body, of variable colour, but commonly whitish;—the pupil contracting and dilating. Cataracts have been divided, by some, into *spurious* and *genuine*. The former, *Pseudocataracta*, where the obstacle to vision is between the capsule of the lens and the uvea: the latter, where it is in the lens or capsule.

A *lenticular cataract* is where the affection is seated in the lens;—a *capsular* or *membranous*, in the capsule. The capsule is divided again, by Beer, into the *anterior*, *posterior*, and *complete capsular cataract*. When the capsule is rendered opaque, in consequence of an injury, which cuts or ruptures any part of it, it thickens, becomes leathery, and has been called *Cataracta arida siliquosa*. *Cataracta Morgagniana lactea* seu *puriformis* is the milky variety, in which the crystalline is transformed into a liquid similar to milk, (F.) *Cataracte lacteuse*; or, as generally defined, in which there is opacity of the fluid situated between the lens and its capsule. The *capsulolenticular* affects both lens and capsule, (*Achrystallodiaphanie*, *Adiaphanie përichrystatique* of Piorry,) and Beer conceives the liquor Morgagni, in an altered state, may contribute to it. Cataracts are also called *hard* (*Sclerocataracta*), *soft* (*Phacomata'cia*), *stony* (F. *pierreuse*), *milky* or *cheesy* (*lacteuse* ou *caseuse*), *Galactocataracta*, *Cataracta lacteicolor*, according to their density:—white, pearly, yellow, brown, gray,

green, black, (F.) *blanche*, *perlée*, *jaune*, *brune*, *grise*, *verte*, *noire*, according to their colour:—*fixed* or *vacillating*—*cataracta capsulolenticularis fixa* vel *tremula*, (F.) *fixe* ou *branlante*, according as they are fixed or movable behind the pupil. They are likewise called *Cataracta marmoracea*, *fenestrate*, *stellate*, *punctate*, *dimidiata*, &c., according to the appearances they present.

They may be *simple* or *complicated* with adhesion, amaurosis, specks, &c.; and *primary* or *secondary*, when the opacity is the result of the operation.

Cataract is commonly a disease of elderly individuals, although, not unfrequently, *congenital*. It forms slowly; objects are at first seen as through a mist; light bodies appear to fly before the eyes, and it may not be until after months or years that the sight is wholly lost. No means will obviate the evil except an operation, which consists in removing the obstacle to the passage of the light to the retina. Four chief methods are employed for this purpose. 1. *Couch'ing* or *Depression*, *Hyalonix'is*, *Hyalonyx'is*, *Crystallocatapsis*, *Crystallocatath'esis*, (F.) *Abaissement ou Déplacement de la Cataracte*. This consists in passing a cataract needle through the sclerotica and subjacent membranes, a little above the transverse diameter of the eye; and at about two lines' distance from the circumference of the transparent cornea, until the point arrives in the posterior chamber of the eye. With this the crystalline is depressed to the outer and lower part of the globe of the eye, where it is left. 2. *By absorption*,—by the French termed *broiement* or *bruising*. This is performed in the same manner as the former; except that, instead of turning the crystalline from the axis of the visual rays, it is divided by the cutting edge of the needle, and its fragments are scattered in the humours of the eye, where they are absorbed. 3. *By extraction*, which consists in opening, with a particular kind of knife, the transparent cornea and the anterior portion of the capsule of the crystalline; and causing the lens to issue through the aperture. Each of the processes has its advantages and disadvantages, and all are used by surgeons. 4. Some, again, pass a cataract needle through the transparent cornea and pupil to the crystalline, and depress or cause its absorption. This is called *Ceratonyxis*. See, also, *Reclination*.

A discharge of fluid from a mucous membrane. The ancients considered catarrh as a simple flux, and not as an inflammation. Generally it partakes of this character, however. *Catarrh* is, with us, usually restricted to inflammation of the mucous membrane of the air-passages: the French extend it to that of all mucous membranes; (F.) *Flux muqueux*, *Fluxion catarrhale*.

A substance, used for 'firing,' burning, or disorganizing the parts to which it is applied. Cauteries were divided by the ancients into *actual* and *potential*. The word is now restricted to the red-hot iron; or to positive burning. It was, formerly, much used for preventing hemorrhage from divided arteries; and also with the same views as a blister. The term *Potential Cautery*, *Cauterium potentiale*, *Ignis potentialis*, (F.) *Feu potentiel*, was generally applied to the *causticum commune*, but it is now used synonymously with caustic in general. *Cautère* also means an issue.

CAUTERIZATION, *Cauterisatio*, *Cauteriasmus*, (from *καυτήριον*, 'I cauterize,') *Exustio*, *Inustio*, *Caustica Adustio*. Firing. The effect of a cautery or caustic. The French, amongst whom cauterization is much used, distinguish five kinds: 1. *Cauterisation Inhérente*, which consists in applying the actual cautery freely, and with a certain degree of force, so as to disorganize deeply. 2. *Cauterisation transcurrente*, which consists in passing the edge of the *Cautère cutellaire*, or the point of the *Cautère conique*, lightly, so as not to disorganize deeply. 3. *Cauterisation par pointes*, which consists in applying on the skin, here and there, the hot point of the conical cautery, with sufficient force to cauterize the whole thickness of the skin. 4. *Cauterisation lente*, *slow cauterization*, by means of the *moxa*. 5. *Cauterisation objective*, which consists in holding the cautery at some distance from the part to be acted upon by it.

The *vena cava inferior*, *abdominalis seu ascendens*, arises from the union of the two *primary iliaes*, opposite the fourth or fifth lumbar vertebra, receives the *middle sacral*, *lumbar*, *right spermatic*, *hepatic*, and *inferior diaphragmatics*, and opens at the posterior and inferior part of the right auricle.

CAVERNOUS, *Cavernosus*, (F.) *Caverneux*. Filled with small cavities or caverns,—as a sponge.

CAVERNOUS BOD'IES, *Corpora Cavernosa* of the penis, *Corpora Nervosa seu Nervospongiosa Penis*, (F.) *Corps Caverneux*. The *corpus cavernosum* is a kind of cylindrical sac, composed of cells; separated, through its whole extent, by a

vertical, incomplete septum, *Septum pectiniforme*, *Trabeculae corporum cavernosorum*, and forming nearly two-thirds of the penis. The *corpus cavernosum*, on each side, arises from the ascending portion of the ischium, and terminates obtusely behind the glans. The arteries of the corpora cavernosa come from the internal pudic. See *Helicine Arteries*. Nerves are found on the surface of the outer membrane, but they do not appear to penetrate the substance; and the smooth muscular fibre has been traced into the fibrous parietes of the cells, as in the case of all erectile tissues.

J. Müller's researches have led him to infer, that both in man and the horse, the nerves of the corpora cavernosa are made up of branches proceeding from the organic as well as the animal system, whilst the nerves of animal life alone provide the nerves of sensation of the penis.

CAVERNOUS BODIES (*Corpora Cavernosa*) of the *Clitoris*, are two hollow crura, forming the clitoris.

CAVERNOUS BOD'Y OF THE VAGI'NA, *Corpus Cavernosum Vaginae*, *Plexus retiformis*, *Sinus of Santorini*, is a substance composed of blood-vessels and cells, similar to those of the penis and clitoris, which covers the outer extremity of the vagina, on each side. It serves to contract the entrance to the vagina during coition. See *Bulbus vestibuli*.

CAVERNOUS GANGLION, see *Carotid* or *Carotic Nerve*.

CAVERNOUS RESPIRATION. When a cavity exists in the lungs, and one or more ramifications of the bronchia terminate in it, a loud tubal noise is emitted, provided the cavity be not filled with fluid, which is called *cavernous respiration*. In this condition, the cough likewise is *cavernous*, (F.) *Toux Caverneuse*. When the capacity of the cavern is very great, the sound of the respiration is like that produced by blowing into a decanter, with the mouth at a little distance from the neck. This kind of cavernous respiration has been called *amphoric*, from *amphora*, 'a flask;' (F.) *Respiration amphorique*, *Souffle amphorique*, *S. métallique*.

The *Veiled Puff*, (F.) *Souffle voilé*, is a modification of the cavernous respiration, in which, according to Laënnec, "a sort of movable veil interposed between the excavation and the ear" seems to be agitated to and fro. It is a sign which is not much attended to.

CAVERNOUS RHONCHUS, see *Cavernous Respiration*, and *Gurgling*.

CAVERNOUS SI'NUS, *Si'nus Cavernosus* seu *polymorphus* seu *sphenoidalis*, *Receptaculum sellæ equinae lateribus oppositum*, (F.) *Sinus cavernosus*. The *Cavernous Si'nuses* are venous cavities of the dura matter, filled with a multitude of reddish, soft filaments, intersecting each other; and, as it were, reticulated. They commence behind the inner part of the sphenoid fissure, pass backwards on the sides of the fossa pituitaria, and terminate by opening into a cavity, common to the superior and inferior petrosal sinuses. They receive some meningeal veins, the ophthalmic veins, &c. The anterior extremity of each cavernous sinus has been named the *ophthalmic sinus*.

CAVERNOUS TEX'TURE OF TIS'SUE, *Tela cavernosa*, (F.) *Tissu Caverneux*. The spongy substance which forms the greater part of the penis and clitoris. It seems to consist of a very complicated lace-work of arteries and veins; and, probably, of nervous filaments, with small fibrous plates, which form by their decussation numerous cells communicating with each other. This spongy texture produces erection, by dilating and swelling on the influx of blood; and probably, also, by virtue of some property inherent in it.

CAVERNOUS WHISPER. A blowing sound, heard over cavities when words are whispered.

The cerebellum is divided into two lobes or hemispheres or lateral masses, *Lobus superior anterior* seu *quadrangula'ris*, and *Lobus superior posterior* seu *semiluna'ris*, and each lobe is again subdivided into *Monticuli* or *Lob'ules*. In the cerebellum are to be observed

CEREBRUM or **CERE'BRUM**, (*κεφα*, 'the head,') The brain. (F.) *Cerveau*, *Cervelle*. This term is sometimes applied to the whole of the contents of the cranium: at others, to the upper portion; the posterior and inferior being called cerebellum. The brain, properly so called, extends from the os frontis to the superior occipital fossæ. Anteriorly, it rests on the orbital vault: behind this, on the middle fossæ of the base of the cranium; and, posteriorly, on the *tentorium cerebello superextensum*. The upper surface is divided by a deep median cleft (*Scissura interlobaire*, —Ch.) into two halves, called *hemispheres*, which are united at the base by the *corpus callosum*. At its surface are numerous *convolutions*. The inferior surface exhibits, from before to behind, three lobes, distinguished into *anterior*, *middle*, and *posterior*. The middle is separated from the anterior by the *fissure of Sylvius*; and from the posterior, by a shallow furrow which corresponds to the upper portion of the *pars petrosa*. Internally, the brain has, on the median line, the *corpus callosum*, *septum lucidum*, *fornix*, *pineal gland*, and *third ventricle*:—and, laterally, the *lateral ventricles*, in which are the *corpora striata*, *optic thalami*, &c. It is contained in a triple envelope, (see *Meninges*.) Its texture is pulpy, and varies according to age. Two substances may be distinguished in it—the *white*, *medullary*, *tubular* or *fibrinous*—*medulla cerebri*, (F.) *Pulpe cérébral*,

Substance blanche, and the *cortical, cineritious, vesicular, or gray*, (F.) *Substance grise*. The former is white; and occupies all the interior and base of the brain. The latter is grayish and softer. It is situate particularly at the surface of the organ.

The brain receives several arterial vessels, furnished by the internal carotid and vertebral. Its veins end in the sinuses. It is the material organ of the mental and moral manifestations. According to Gall, each part is the special seat of one of those faculties, and the brain and cerebellum, inclusive, are called by him, '*the nervous system of the mental faculties*.' See Craniology.

The substance of the nervous system—*Neurine*—was analyzed by Vauquelin, and found to contain water, 80.00; white fatty matter, 4.53; red fatty matter, called *cerebrine*, 0.70; osmazome, 1.12; albumen, 7.00; phosphorus, 1.50; sulphur, acid phosphates of potassa, lime, and magnesia, 5.15.

CHLO'RINE, (*χλωρος*, 'green.') *Chlo'rinum*, *Chlorin'ium*, *Chlo'rum*, *Chlo'ra*, *Halogen'ium*, *Oxy-muriatic Ac'id Gas*, *Oxygenated Muriatic Ac'id Gas*, *Dephlogisticated Marine Ac'id*, *Hal'ogene*, *Mu'rigene*, (F.) *Chlore*. So far as we know, this is an elementary substance. It is a greenish, yellow gas, of a strong suffocating smell, and disagreeable taste; incapable of maintaining combustion and respiration, and very soluble in water. One of its characteristics is, that of destroying, almost immediately, all vegetable and animal colours. It is employed in fumigations as a powerful disinfecting agent. A dilute solution, *A'qua seu Li'quor Chlo'rini*, *Chlorin'ii Li'quor*, *Chlo'rini ei aqua*, *Aqua Chlorin'ii* (Ph. U. S., 1863), *Liquor Chlo'ri*, *Chlo'rine water*, *Solution of Chlo'rine*, (F.) *Chlore liquide*, has been administered internally, in certain cases of diarrhœa and chronic dysentery. A formula for its preparation, by disengaging chlorine from black oxide of manganese, by means of muriatic acid; and causing it to pass into water, has been admitted into the Pharmacopœia of the United States for 1863.

Immersion of the hands and arms in chlorine has often removed itch and other cutaneous affections. It has also been inhaled in a dilute state in the early stage of phthisis, but it is of doubtful efficacy, and is better adapted for chronic bronchitis.

CHLORINE, BISULPHURET OF, Sulphur, chloride of.

CHLOROÂNÆMIA, (*χλωρος*, 'green,' and *anæmia*.) Chlorosis.

CHLO'RODYNE. A secret preparation, proposed, in 1848, by a Dr. Browne of India; and said, by him, to consist of "perchloric acid with a new alkaloid." It has been given as an anodyne chiefly; but being a nostrum, is only worthy of mention for its notoriety.

CHLO'ROFORM, *Chloroform'um*, *Chloroform'ium*, (from *chlorine*, and *formyl*.) *Carbo'neum seu Formylum chlorat'um*, *Superchlor'idum formyl'icum*, *Perchloride and Terchloride of Formyl*, *Chloroform'yl*, called also, but not correctly, *Terchloride of Car'bon*, and *Chlo'ric ether*, *Æther chlo'ricus*;—(F.) *Chloroforme*, *Chloréthérde*, is a colourless, oleaginous liquid, of a sweetish ethereal odour, hot, aromatic, and peculiar taste. The specific gravity of that of the Ph. U. S., *Chloroform'um venale*, is 1.45 to 1.49. It may be obtained by distilling from a mixture of chlorinated lime and alcohol,—rectifying the product by redistillation, first from a great excess of chlorinated lime, and afterwards from strong sulphuric acid. It has been used with advantage in asthma, and in diseases in which a grateful soothing agent is required. Dose, grt. x to fʒss or more, diluted with water. It is largely prescribed, and with great success, as an anæsthetic agent in painful diseases; and to obtund sensibility in surgical operations and in parturition,—especially in the way of inhalation; but its use requires caution. The usual quantity with this view is from fʒss to fʒij. See Anæsthetic.

The Pharmacopœia of the United States (1863) has a *Chloroformum purifica'tum*, which is made by adding sulphuric acid to commercial chloroform; decanting the lighter liquid, and mixing it with stronger alcohol; adding carbonate of potassa, previously heated to redness, and rubbed, while warm, into powder. The mixture is, then, thoroughly agitated, and, by means of a water bath,

distilled to dryness. Its s. g. varies from 1.490 to 1.494.—s. g. (Ph. B., 1864) 1.496.

A disease which affects young females, more particularly those who have not menstruated. It is characterized by a pale, lurid complexion, languor, listlessness, depraved appetite and digestion, palpitation, &c. The disease generally goes off on the occurrence of the menstrual flux; but sometimes it is long before this is established, and, at times, the catamenia are in much larger quantity than usual. To this last form M. Trousseau has given the name *chlorose hémorrhagique*.

The blood of chlorosis is generally thin, light-coloured and deficient in red corpuscles, and in iron,—*achalybhmie* of Piorry, and the clot is in less proportion to the serum than in health. On auscultation, a bellows' sound has been almost invariably detected over the heart, and a continuous blowing sound in the larger arteries, (especially the carotids and subclavians,) reinforced by each systole of the ventricle, and resembling the buzzing of a humming-top, the cooing of doves, the whistling of air through a key-hole, &c., (see *Bruit*.) Very similar sounds are heard in the arteries after copious hemorrhage: they seem, therefore, to coincide with enfeebled circulation.

Tonics—as iron—are usually required in the treatment,—the disease most commonly occurring in those in whom there is considerable torpor of the system.

CHOC'OLATE, *Jac'olatt*, *Chocola'tum*, *Chocola'ta*, *Succola'ta*, *Succocollo'ta*. (Dr. Alston says, that this word is compounded from two East Indian words:—*choco*, 'sound,' and *atte*, 'water,' because of the noise made in its preparation [?] Another derivation is from *Choco*, a province in Mexico, where the tree abounds, and whence it was imported into Europe about 1520.) An alimentary paste prepared from the kernels of *Theobroma cacao* or *Cacao*, with sugar, and often aromatics. (See *Cacao*.) The chocolate thus simply prepared—as it is met with, indeed, in commerce—is called in France, *Chocolat de santé*, *Chocola'ta sin'plex* seu *Salu'tis*. It is not very easy of digestion.

The *chocolat à la vanille* contains three ounces of vanilla and two of cinnamon to twenty pounds of common chocolate. The addition of the aromatic renders it somewhat more digestible. Chocolates may likewise be medicated.

The disease is most common in hot climates,—and in temperate climates, during summer. *Spasmodic*, *Asiatic*, *Malignant*, *Indian*, *Epidemic*, *Pestilential*, *Convulsive Nervous*, *Eastern*, or *Oriental Cholera*, *Asphyx'ia pestilenta*, *Pestilential asphyx'ia*, *Choleric Pestilence*, *Cholera orientalis* seu *Indica* seu *Epidemic* seu *Asphyx'ia*, *Ty'phus Bengalen'sis*, *Cholero-ty'phus*, *Ganglion'itis peripher'ica et medulla'ris*, *Hymenogangli'itis*, *Pantogaugli'itis*, *Cholerrhœ'a lymphatica*, *Paroenter'ia*, *Achol'ia*, *Ty'phoid Fe'ver of India*, *Hyperanthrax'is*, *Enterop'gra Asiatica*, *Triplanchn'ia*, *Triplanchni'itis*, *Hæmatoporrhœ'is*, *Hæmorrhœ'is*, *Morbus ory'zeus*, *Rice disease*, (because supposed by Tytler to be caused by damaged rice,) (F.) *Mort de Chien*, is frightful in the rapidity of its progress, the patient sometimes dying in a few hours from the first onset. In temperate climates, common cholera is not usually a disease of much consequence. It requires that the stomach and bowels should be cleared, and afterwards the irritation be allayed by full doses of opium. In malignant cholera, large doses of calomel, with opiates, form the great reliance of many practitioners. In the worst forms, however, it runs its course, unmodified by treatment.

CHOLÉRA EUROPÉEN, see Cholera—c. Indian, see Cholera—c. Indica, see Cholera.

CHOLERA INFANTUM, *Choleric Fe'ver of Infants*; *Cholera of Infants*, (F.) *Choléra infantile*. A disease so termed by American physicians. It occurs, generally, in the middle states of the Union, in June or July, and continues during the hot weather, hence called the 'summer complaint.' The chief symptoms are vomiting, purging of green

or yellow matter, slime or blood, attended with pain or uneasiness, and swelling of the abdomen, with some pyrexia, generally. The heat of the weather seems to be the predisposing, if not the exciting, cause. It is a fatal disease in towns; differing little, if at all, from what is vulgarly called the *Watery Gripes* in England. Clearing, gently, the alimentary canal, so as to remove the offending matter, and then exhibiting chalk mixture and laudanum, with counter-irritants, as spice cataplasms to the abdomen, is the most satisfactory plan of treatment.

The characteristics are:—irregular and involuntary motions of one or more limbs, and of the face and trunk. It is a disease which usually occurs before puberty; and is generally connected with torpor of the system, and of the digestive organs in particular. Its duration is long, but it is usually devoid of danger; although frequently but little under the control of medicine. The spasms do not continue during sleep. The indications of treatment are: to strengthen the general system, and stimulate the intestinal canal. Purgatives, once or twice a week, and chalybeates, with appropriate regimen, will fulfil these.

CHO'RION, (*χοριον*, 'skin,' from *χρῆν*, 'to contain,' (include); [?]) *Camis'ia Fœ'tūs*. A thin, transparent membrane, formerly confounded with the decidua, which surrounds the fœtus in utero on every side, and appears to be developed

from nucleated cells formed in the Fallopian tube. Some histologists, however, consider, that it exists in the ovary. The general opinion is, that it is formed as above described; and perhaps, also, from the zona pellucida, which disappears in the tube. In the uterus, villous prolongations are formed on its surface, which have given it, with more recent writers, the name '*shaggy chorion*.' These villi are probably the agents of the absorption of nutritive matter furnished from the lining membrane of the uterus.

By many anatomists, the chorion is considered to be formed of two layers; the outer, called by Burdach *Exocho'riou*; the inner, *Endocho'riou*. By others, the distinction of laminæ is denied. It is exterior to the amnion.

CHORION also means the true skin. See *Cutis*. By some, the *Zona pellucida* is so called.

A kind of vasculo-membranous prolongation of the pia mater, which lines the lower surface of the for-nix united with the corpus callosum. It is stretched above the third ventricle, and covers the posterior commissure and corpora quadrigemina. Anteriorly, the tela choroïdea is continuous with the plexus choroïdes.

CHOROÏDEA SEU CHOROÏDEA TE'NICA, *Ch. Mem-brana*, or simply the *Cho'roid*, *Tu'nica vasculo-sa* seu *aciniform'is* seu *rhagoïdes Oculi*, (F.) *Mem-brane choroïde*, *Choroïde*. A thin membrane, of a very dark colour, which lines the sclerotica internally. The part behind the iris is called *U'vea*. It is situate between the sclerotica and retina, has an opening, posteriorly, for the passage of the optic nerve; and terminates, anteriorly, at the great circumference of the iris, where it is continuous with the ciliary processes. Its outer surface is pretty intimately attached to the sclerotica by bloodvessels and nerves, as well as by a delicate brown tissue, which has been called *Lam'in fus'ca*.

According to Ruysch, the choroid consists of two layers, to the innermost of which his son gave the name *Tu'nica* seu *Membrana Ruyschiana*, *M. choriocapilla'ris*, (F.) *Membrane Ruyschienne*. The internal surface of the membrane is covered with a dark pigment, consisting of several layers of pigment cells, called *Pigmen'tum nigrum*, *Stru'tum pigmen'ti*, *Ophthalmochroï'tes*, *Æ'thiops animat*, *Mélanine*, *Mélanine*, *Matière ou Principe de la Mélanose*, (F.) *Enqûit choroïdien*. CHYLE, *Chylus*, *Succus nutritivus*, (χυλος, 'juice,' from χύω, 'I pour,') The word, in Hippocrates, means *Tisane* or *Decoction of Barley*, *Chylarion*. Galen first used it in its present sense:—i.e. for a nutritive fluid, extracted by intestinal absorption, from food which has been subjected to the action of the digestive organs. It is of a whitish appearance; and is formed from the chyme in the duodenum, and the rest of the small intestines, by the chyloferous vessels, which arise at the mucous surface of the intestine. Along these it passes through the mesenteric glands to the thoracic duct, and is finally poured into the left subclavian. It is composed, like the blood, of a fluid—*liquor chyli*—and of *chyle corpuscles* or *globules*, the average size of which is about 1-4600th of an inch. They, who regard the chyle to be nothing more than fatty matter of the food, apply the term to the emulsified oil in the intestinal canal even before it is taken up by the chyloferous vessels. See *Chyme*.

A branch of the natural sciences, whose object is to investigate the nature and properties of bodies, simple and compound, inorganic and organized; and to study the force or power, by virtue of which every combination is effected. It investigates the action between the integrant molecules or atoms of bodies.

Organ'ic Chemistry, *Chym'ia organ'ica*, *Organo-chem'ia*, is the chymistry of organized substances,—animal and vegetable. *Animal Chym'istry*, *Zoich'emy* or *Zoich'ymy*, *Zoichemi'a*, is the chymistry of substances afforded by the dead or living animal body. This branch of chymistry has been farther subdivided into *physiolog'ical*, when it considers the changes produced in organized bodies in health,—*patholog'ical*, when it regards those produced by organic or other diseases. *Anthropoch'ymy*, *Anthropochemi'a*, is the chymistry of the human body. Chymistry is called *Therapeut'ical* or *Pharmacu'tical*, *Pharmaco-chym'ia*, *Chym'ia pharmaceu'tica*, when it is engaged in the analysis of simple medicines; in improving the prescribing and preparing of chemical and Galenical medicines; in the means of preparing them, and detecting adulterations, &c. *Hygien'ic Chym'istry* is that which is applied to the means of rendering habitations healthy, of analyzing the air we breathe, preventing the occurrence of disease, pointing out healthy aliments, and appreciating the influence of professions, &c., on the health of man. All these different subdivisions, with vegetable chymistry, *Phytochymistry*, are, at times, included under the head of *Med'ical Chym'istry*; at others, the term comprehends only the *Animal*, *Veg'etable*, and *Pharmaceut'ical* subdivisions. *Vital Chemistry*, *Biochym'ia*, is that which is exerted under the influence of vitality. *Histochem'ymy*, *Histochemi'a*, *Histochem'istry*, is the chemistry of the tissues, and *Phlegmatochem'ymy*, that of the animal humours.

A knowledge of chemistry is of great importance to the physician. Many of the functions are of a chemical nature: many diseases require a chemical mode of treatment; and, without an acquaintance with it, two or more substances might be given in combination, which, by forming a chemical union, might give rise to other

compounds, possessing very different virtues from the components taken singly, and thus the prescriber be disappointed in the results.

CIL'IA (singular *Cil'ium*), *Blephar'idæ*, *Epica'lidæ*, *Pili palpebra'rum*, *Eyelashes*, (Sc.) *Wink'ers*. The hairs on the eyelids. (F.) *Cils*. Their use seems to be, to prevent the entrance into the eye of light bodies flying in the atmosphere; and to diminish, in certain cases, the intensity of light. Also, the tarsi, eyelids. Likewise, a peculiar sort of moving organs, resembling small hairs, *vibratory* or *vibratile cil'ia*, *Cil'ia vibrato'ria*, (F.) *Cils vibratils*, *Tromyles*, which are visible with the microscope in many animals. These organs are found on parts of the body which are habitually in contact with water, or other more or less fluid matters, and produce motion in these fluids, impelling them along the surface of the parts. Cilia have been found to exist in all vertebrated animals except fishes, having been discovered on the respiratory, uterine, and other membranes of mammalia, birds, and reptiles.

The terms '*vibratory motion*' and '*ciliary motion*' have been used to express the phenomena exhibited by the moving cilia; and it is probable, that this motion is concerned in the progression of fluids along the membranes. As yet, the motion has only been observed in the direction of the outlets of canals.

CILIAIRE, *Ciliary*.

CILIARY, *Cilia'ris*, (F.) *Ciliaire*. Relating to the eyelashes, or to *cilia*. This epithet has, also, been applied to different parts, which enter into the structure of the eye; from the resemblance between some of them (the *ciliary processes*) and the eyelashes.

CILIARY ARTERIES, *Art'erie cilia'res*, (F.) *Ar'tères ciliaires*. These are furnished by the ophthalmic artery. They are distinguished into, 1. *Short or poste'rior* (*Art. vésicales*—*Chauss.*), 30 or 40 in number, which are distributed to the ciliary processes. 2. *Long*, (*Art. Iriennes* of *Chauss.*) two in number, which, by the anastomosis of their branches, form two arterial circles at the anterior surface of the iris; and, 3. The *ante'rior*, *Art'erie cilia'res ante'iores* of *Haller*, the number of which is variable. These pierce the sclerotic a few lines from its union with the cornea; and are principally distributed to the iris.

CILIARY BOB'Y, *Cor'pus Cilia'rè*, *Nex'us Stamin'eus Oculi*, *Coro'na Cilia'ris*, *Ciliary Disc*, (F.) *Corps ciliaire*. A ring of the choroid surrounding the crystalline in the manner of a crown, placed behind the iris and the ciliary circle. It resembles the disk of a radiated flower, and is formed by the union of the ciliary processes. See *Ciliary Muscle*.

CILIARY CANAL, *Canal of Fonta'na*. A small, extremely narrow circular space, formed between the ciliary circle, the cornea, and the sclerotic. It can be filled with injection, and it is not certain that it is not the cavity of a blood-vessel.

CILIARY CIRCLE, *Ciliary ligament*—c. *Disc*, *Ciliary body*—c. *Ganglion*, *Ophthalmic ganglion*.

CILIARY LIG'AMENT, *C. Cir'cle* or *Ring*, *Ligamentum seu Intertit'ium cilia'rè* seu *Pridin*, *Plex'us cilia'ris*, *An'nulus* seu *Cir'culus* seu *Orbic'ulus cilia'ris*, *A. cellulo'sus*, *Com'missure of the U'nea*,

(F.) *Commissure de la Choroïde*—(Ch.), *Ligament ou Cercle ciliaire, Cercle de la Choroïde, Ceinture blanche de la Choroïde*. A species of greyish ring, of a pulpy consistence, situate between the choroid, iris, and sclerótica. The internal surface of the choroid is uniform, until it approaches within ten lines and a half of the edge of the cornea; here a dentated line is observed, termed *o'ra serrata*. The outer surface presents the *an-nulus albidus seu gangliiformis*, the anterior edge of which unites to the inner surface of the sclerótica and constitutes the *ciliary ligament*.

CILIARY OF TAR'SAL MAR'GIN of the eyelids; (F.) *Bord ciliaire*. The edge in which the cilia or eyelashes are situate.

CILIARY MOTION, see *Ciliary*.

CILIARY MUS'CLE, *Musculus ciliaris*. The part of the orbicularis palpebrarum in the vicinity of the ciliary margin. Also, the greyish, semi-transparent structure behind the ciliary ligament, and covering the outside of the ciliary body. By its contraction the ciliary processes, and with them the lens, must be drawn towards the cornea. It appears to be the same muscle as the *Ten'sor choroïdæ, Pro'trahens len'tis, Choroid muscle* of some anatomists.

CILIARY NERVES, (F.) *Nervi ciliares, Nervi Iriens*. These are 12 to 16 in number. They arise from the nasal nerve, and particularly from the anterior part of the ophthalmic ganglion; and unite in two fasciculi, which pass around the optic nerve, and pierce the sclerótica near the entrance of that nerve into the eye. They are lost in the ciliary ligament.

CILIARY PLEXUS, C. Ligament.

CILIARY PROC'ESSES, *Processus seu Radii seu Striæ ciliares*, (F.) *Prociæ ciliares, Rayons sous-iriens*—(Ch.). Triangular folds, sixty or eighty in number, placed at the side of each other, and radiating so as to resemble the disk of a radiated flower. They are lodged in depressions at the anterior part of the vitreous humour. The uses of these processes are not known.

CILIARY RING, *Ciliary ligament*.

CILIARY STRIÆ are numerous pale, radiated striæ in the posterior portion of the *Corpus ciliare*, but so covered by the *Pigmentum nigrum* as not to be distinctly seen till the paint is removed. The ciliary processes are formed by these striæ.

CILIARY VEINS, (F.) *Veinæ ciliares*, follow nearly the same course as the arteries. In the choroid they are so tortuous, that they have received the name *Vasa vortico'sa*. They open into the ophthalmic vein.

CILIARY ZONE, *Zo'na seu Zo'nula seu Lam'ina Ciliaris, Membran'ula Coro'næ Ciliaris*. Under the corpus ciliare, the capsule of the vitreous humour sends off an external lamina, which accompanies the retina, and is inserted, with it, into the forepart of the capsule of the lens, a little before its anterior edge. This is the *Zo'nula ciliaris, Zo'nula Zinnii* or *Zo'nula of Zinn, Coro'na Ciliaris, Orbic'ulus Ciliaris*. It is of a striated appearance and circular form, and assists in fixing the lens to the vitreous humour.

CILIATED, *Ciliatus*, (F.) *Cilié*. Provided with cilia—as '*ciliated epithelium*,' the epithelium to which vibratory cilia are attached.

CILIUM, see *Cilia*.

CILLEMENT, (from *cilia*.) Nictation.

CINCHO'NA or CHINCHO'NA. (So called from the Spanish Viceroy's lady, the Countess de Chinchon, who was cured of fever by it at Lima, about 1638.) Called also *Cor'tex seu Pul'vis Jesuiticus, Jesuit's Bark or Pow'der, Cor'tex Patrum*, because it was introduced into Europe by the Jesuits; also *Pul'vis Comitis'sæ* or the *Countess's Pow'der*, and *Cardinol del Lu'go's Pow'der, Cor'tex Cardina'lis de Lu'go*, because he introduced it at Rome; and in France, *Tal'bor's Pow'der* and *English rem'edy*, because successfully used there by Sir Robert Talbor, who kept it a secret. It is the pharmacopoeial name of several kinds of barks from various species of *Cinchona*, from the western coast of South America. Order, *Cinchonaceæ. Sez. Syst. Pentandria Monogynia*. The richest in the antiperiodic alkaloids is said to be the bark of *Cinchona succirubra* of Ecuador, which, with other species, has been transplanted to India and other countries. Called, also, *Cor'tex, Bark, Peruvian Bark, Cor'tex Chinæ seu Chi'ná, Chinch'na, Pal'o de Calenturas, Ki'na Ki'na* or *Qui'na Qui'na, (Bark of Barks,) Kinki'na, Ci'na Ci'na, Quinquina, Mag'num De'i donum*, (F.) *Quinquina*; and in Peru *Cascara* and *Cascarilla*. CINCHONÆ CARIBÆÆ COR'TEX, from *Exostema Caribæum, Carribæan* or *Saint Lucie's Bark*, (F.) *Écorce de Saint Lucie, Quinquina Piton*, from *Exostema* or *Exostem'na, floribundum*; and the *Pitaya Bark, Quinquina bicolor*, from an *exostema* [?] or from *strychnos pseudoquina* [?], are useful substitutes for the cinchona of Peru. These are the most important spurious barks. They contain neither quinia nor cinchonia.

CINCHONÆ CORDIFOLIE COR'TEX, *Cor'tex flavus, Cincho'næ officina'lis cor'tex flavus, Chi'na*

re'gia seu *Calisay'a*, *Cor'tex Chi'na re'gus* seu *fl'a'vus* seu *lu'teus*, Yellow, Royal or Calisay's cinchona Bark, (F.) *Quinquina jaune* ou *jaune royal*, Calasaya. Odour aromatic; taste strong, bitter, astringent. Not rolled; often without the epidermis, which is very thick and inert; light, friable; fracture fibrous. Active principle *Qui'nia*. The false or spurious Calisaya barks are those of *Cinchona Calisaya*, variety *Josephia'na*; *C. Bolivia'na*, *C. ova'ta*, variety *rufinervis*, called, in Peru, *Cascarilla Carabaya*—the Carabay's bark of commerce;—of *C. scrobiculata*, two varieties, *Cus'co* bark and *Bark of St. Ann*; of *C. pubes'cens*, which furnishes the *Cus'co* or *Ari'ca* bark, and of *C. amygdalifolia*.

CINCHONÆ LANCIFOLIÆ COR'TEX, *Cor'tex Peru'ria'na* seu *pal'lidus*, *Cincho'næ officina'lis cor'tex communi's*, *Cincho'na pal'lida*, Pale Cincho'na Bark, Pale, Loxa or Crown Bark, (F.) *Quinquina gris de Loxa*, *Quinquina Orange*. The bark of *Cincho'na Condamine'a* and *C. micran'tha*. Its odour is aromatic; taste pleasant, bitter, and astringent. The pieces are rolled in double or single quills. Epidermis brown, cracked; fracture resinous. Internally of a cinnamon colour. Its active principle is *Cincho'nia*.

CINCHONÆ OBLONGIFOLIÆ COR'TEX, *Cor'tex ruber*, *Cincho'næ officina'lis cor'tex ru'ber*, Red Cinchona Bark, Red Bark, (F.) *Quinquina rouge*, (S.) *Cascarilla roja* and *C. colorada*, of S. America. Odour and taste the same as the pale, but more intense: in large flat pieces, solid, heavy, dry; fracture short and smooth; of a deep brownish-red colour. Although this variety of bark is assigned to the *Cinchona oblongifolia* and *C. Succirubra* by some, it would seem, that nothing is certainly known as to its source. Active principles, *Cincho'nia* and *Qui'nia*.

The last three are the only official varieties in the Pharmacopœia of the United States. There are many other varieties, however, which are genuine cinchona barks, and yet have not been considered worthy of an official position. The Edinburgh Pharmacopœia admitted, indeed, *Cincho'na cin'erea*, Grey bark, Silver bark or Huanuco or Li'na bark, which is obtained around Huanuco in Peru, and, with the Jaen or Ash bark and the Huamiles bark, belongs to the class of pale or Loxa barks. Amongst the genuine but inferior barks are those brought from the northern Atlantic ports of South America, which, in commerce, are variously called *Pitaya*, *Bogota*, *Cartagena*, *Maracaybo*, and *San'ta Mar'tha* barks. The *Bogota* is also called *Fusagasuga* and *Coquette* bark.

All these barks are bitter, astringent, tonic, and eminently febrifuge. The yellow bark has been thought equal to any of the others, but the red contains more active principle. The discovery of their alkaloids is one of the most important gifts of modern chymistry. Still, in pernicious intermittents, the bark, in substance, is often demanded. It is employed in every disease in which there is deficient tone; but in cases where the stomach is much debilitated, the powder had better be avoided, in consequence of the woody fibre, which might disagree. Externally, it is used in enemata, gargles, &c., and in gangrenous ulcerations. When it excites nausea, an aromatic may be added to it; if purging, opium; if costiveness, rhubarb, &c. Dose, ʒss to ʒj or more.

ESSENTIAL SALT OF BARK, as it is called, is an extract, prepared by macerating the bruised substance of bark in cold water, and submitting the infusion to a very slow evaporation.

Cinchonine, and its sulphate, possess the same medical properties as cinchona and its salts. Dose, gr. v to gr. xv.

CINCHONINE, *Cincho'ni'na*, *Cincho'nia*, *Cincho'nia*. The active principle of *Cincho'na lance'folia*. An organic, crystalline alkali; of a white colour, and bitter, slightly astringent taste; very soluble in alcohol and ether, but almost insoluble in water.

Cincho'niæ Sulphas, *Sul'phate of Cincho'nia*.—which is formed directly from cinchonine, by dissolving cinchonine, obtained from the mother-water remaining after the crystallization of sulphate of quinia by precipitation by means of solution of soda; treating it frequently with alcohol to remove other alkaloids; adding sulphuric acid to saturation, and crystallizing,—is soluble in water and alcohol. The action of the sulphate of cinchonine is similar to that of the sulphate of quinia; but it is less energetic, and consequently requires to be given in a larger dose.

siologists give this name to the motion of the blood through the different vessels of the body—*sanguimotion*;—to that function, by which the blood, setting out from the left ventricle of the heart, is distributed to every part of the body by the arteries through the capillaries;—proceeds into the veins, returns to the heart, enters the right auricle, and passes into the corresponding ventricle, which sends it into the pulmonary artery to be distributed to the lungs, whence it issues by the pulmonary veins, and passes into the left auricle; from this it is sent into the left ventricle, and is again distributed by means of the arteries.

CIRCULATION, CAP'ILLARY, *C. des Parenchymæ*, is that which takes place in the capillary vessels; and is, in some measure, independent of the action of the heart. See *Capillary Vessels*.

They were once used in convulsive and epileptic cases. The leaves, *Fo'lia Aurant'ii*, have a bitterish taste, and furnish an essential oil. They have been used for the same purposes as the flowers. The yellow rind of the fruit, *Aurant'ii Cor'tex* (Ph. U. S. 1842), *Citrus Bigara'dia* (Ph. L.), *Bigarade'* or *Bitter Or'ange*, *Or'ange Peel*, is an aromatic bitter, and is used in dyspepsia, and where that class of remedies is required. The *Juice*, *Suc'cus Aurant'ii*, *Or'ange juice*, is a grateful acid, and used as a beverage in febrile and scorbutic affections.

The juice, *Cit'ron*, *Suc'cus Limo'nia*, *Limo'num Suc'cus* (Ph. L.), (F.) *Suc du Limon*, *Suc de Citron*, is sharp, but gratefully acid, the acidity depending upon the citric acid it contains, and is given as a refrigerant beverage in febrile affections. In doses of half an ounce to an ounce, three times a day, it has appeared to some to exert a sedative influence on the circulation, and has been given, apparently with benefit, in acute rheumatism and rheumatic gout. Alone, or combined with wine, it is prescribed in scurvy, putrid sore throat, &c. Its general properties are refrigerant and antiseptic. Sweetened and diluted, it forms *Lemonade*. *Artific'ial lem'onjuice* is made by dissolving an ounce of citric acid in fourteen fluidounces of water; adding a few drops of essence of lemon.

Lemon'peel tea or *wa'ter* is made by paring the rind of one lemon, previously rubbed with half an ounce of sugar: the peelings and sugar are then put into a jar, and a quart of boiling water is poured over them. When cold, the fluid must be poured off, and a tablespoonful of lemon juice be added.

It is an agreeable drink in fevers.

Cit'ron Tree is likewise considered to belong to the same species—*Citrus Med'ica*. Its fruit is called *cedrome'la*. It is larger and less succulent than the lemon. *Cit'ron juice*, when sweetened with sugar, is called by the Italians *Agro di Cedro*.

CLIF'TON, CLIMATE OF. The vicinity of Clifton and of Bristol, England, appears to be the mildest and driest climate in the west of England; and, consequently, the best winter residence in that part of the country, for invalids. It is, also, a favorable summer climate, and is surrounded by numerous places of agreeable resort, suited for those who may pass the season there.

CLIMA, gen. *Cli'matis*, (*κλιμα*,) Climate.

CLIMAC'TERIC or CLIMACTER'IC, *Climacter'icus*, *Climat'ericus*, *Climater'ic*, *Climater'icus*, (*κλιμακτηριον*, 'a step,') (F.) *Climactérique* ou *Climaté-rique*. A word, which properly signifies 'by degrees.' It has been applied to certain times of life, regarded to be critical; but is now chiefly applied to certain periods of life, at which great changes occur, independently of any numerical estimate of years. Such are the period of puberty in both sexes; that of the cessation of the menses in women, &c.

CLIMACTERIC YEARS, *Anni Climacter'ici*, are, according to some, all those in the life of man, which are multiples of the number 7, *Septen'niada*.

Others have applied the term to years, resulting from the multiplication of 7 by an odd number. Some have admitted only three *climacterics*; others, again, have extended them to multiples of 9. Most, however, have considered the 63d year to be the *Grand Climacteric*;—63 being the product of the multiplication of 7 by 9, and all have thought that the period of three, seven, or nine, which they respectively adopted, was necessary to the entire renewal of the body; so that there was, at these times, in the economy, none of the parts of which it had previously consisted. The climacteric years have also been called, *Annus hebdomad'ici, scala'ris, gradat'rii, scan'silea, genethli'aci, natalit'ii, fata'les, crit'ici, decreto'rii, hero'ici*, &c. All the notions on the subject are essentially allied to the doctrine of numbers of Pythagoras.

CLIMATAL, Climatic.

CLIMATE, *Cli'ma, Inclina'tio cœ'li*, (F.) *Climat*, (κλίμα, 'a region.') In geography, the word *climate* is applied to a space on the terrestrial globe, comprised between two circles parallel to the equator, and arbitrarily measured according to the length of the days. In a hygienic point of view, it means, since Hippocrates, a country or region, which may differ from another in respect to season, qualities of the soil, heat of atmosphere, &c. Climate, indeed, embraces, in a general manner, all the physical circumstances belonging to each region,—circumstances which exert considerable influence on living beings. The dark complexion of the inhabitants of the torrid zone is easily distinguishable from the paleness of those of the frigid,—so are the diseases. They are all modified, more or less, by climate or locality. Hot climates predispose to abdominal complications in febrile affections; cold climates to thoracic, &c.

One of the most important considerations with regard to climates is their comparative fitness for the residence of invalids, and especially of those who are liable to, or suffering under, bronchitic or consumptive affections. The great object, in such cases, is to select a climate which will admit of regular and daily exercise in the open air, so that the invalid may derive every advantage which this form of revulsion is capable of effecting. To an inhabitant of the northern and middle portions of the United States—and the same applies to Great Britain, France, and the northern parts of the old world—a more southern climate alone has generally been considered to afford these advantages in an eminent degree. During the summer months there are few, if any, diseases, which require a milder climate than that of the United States, or of the milder districts of Europe. The temperature of the winter months is, consequently, the most important object of attention. Equability of temperature

is essential, inasmuch as all sudden changes interfere with the great desideratum—exercise in the open air. In the whole continent of North America the changes are very sudden and extensive. It is not uncommon for the range to be 40°, between two successive days. So far, therefore, as this applies, the American climate is not well adapted to the invalid. In the southern portions, however, of the Union, this objection is counterbalanced by many advantages; and in the North there are many situations which afford a favorable residence to the valetudinarian during the winter. Observation has, indeed, shown, that in Minnesota, at Mackinac, and in Canada, where the air, although very cold, is dry, a sojourn there has proved at least as efficacious as in the warmer climate of the southern portion of the United States, or of Cuba; and hence, many invalids, instead of subjecting themselves to the inconveniences of temporary expatriation, pass the winter, often advantageously, in Minnesota, for example. From the Army Reports it would seem, that the dry air of New Mexico is especially favorable to those who are threatened with consumption.

The following tables exhibit the mean temperature of the year, and of the different seasons—with the mean temperature of the warmest and coldest months at different places in America, Europe, Africa, &c., as deduced from the excellent paper of Von Humboldt on Isothermal Lines, the Meteorological Registers kept by the surgeons of the United States army, under the direction of Surgeon-generals Lovell and Lawson, 1822 to 1860, the work of Sir James Clark on Climate, &c., &c. Recent, full, and, doubtless, accurate details, as regards the climate of different portions of the United States, are contained in the "Army Meteorological Register for Five Years, from January, 1855, to January, 1860"—an appendix to the "Statistical Report on the Sickness and Mortality in the Army of the United States," from January, 1855, to January, 1860: prepared under the direction of Surgeon-general Lawson, by Dr. R. H. Coolidge.

Certain of the following tables show the mean monthly temperature, maximum, minimum, and range, as well as the greatest daily, and mean daily range during the corresponding months—but of different years—at some of the prominent retreats for the valetudinarian in Great Britain, on the continent of Europe, and in the African islands. It is proper, however, to remark, that in no situations, except in those to which an asterisk is affixed, was the register thermometer used. In the others, the observations were made during the *day* only, and consequently the numbers given are far below the real range throughout the twenty-four hours. The places are ranged in the order of their mean temperature.

In the United States, one of the most favourable regions for the phthisical invalid was considered to be Florida. St. Augustine was frequently chosen, but it is liable to north-east storms, which interfere with the out-door movements of the valetudinarian, and are the source of much discomfort. Still, great benefit has often been derived from it as a winter residence. Of the Atlantic Isles, Madeira appears to be best adapted for the consumptive, and those affected with chronic bronchitis. In Italy, Rome, and Pisa,—and in England, Torquay and Undercliff, are to be preferred. Chronic rheumatism and gout are benefited by a warm climate, which, again, is unfavourable to those who are predisposed to cerebral diseases, especially to such as are characterized by debility and mobility of the nervous system—as paralysis, epilepsy, mania, &c. Hypochondriasis and dyspepsia require rather change of climate and travelling exercise than a sojourn in any one. (See the Author's Human Health, Philada., 1844).

The infusion of coffee is an agreeable and wholesome article of diet. It is, to a certain extent, a tonic, and is employed as such in convalescence, especially from fevers, &c. In cases of poisoning by opium, and in old asthma, its use has been extolled. For this purpose the *Moka* is the best. It ought to be newly torrefied, but not too much

burnt; should be strong, and drunk soon after grinding.

A highly nitrogenized alkaloid was first found in coffee, and called *Caff'ein* or *Coff'ein*. It was afterwards discovered in the leaves of the tea plant, and called *Thein*, and in the Guarana of Brazil, and called *Guaranin*. In doses of from 2 to 10 grains, it induces violent nervous and vascular excitement. Caffein—as well as its various salts—the *citrate*, *lactate*, *malate*, and *muriate*, has been given as an antiperiodic in grain doses.

Facit'ious Coffees have been, from time to time, recommended, but they are infinitely inferior to the genuine. Various *substitutes* have been proposed; *wheat*, *barley*, *hollyberries*, *acorns*, *sun-flower seeds*, *beech-mast*, *peas*, *beans*, *succory-root*, *seeds of gooseberries* and *currants* left in making wine, and washed,—*sliced turnips*, &c. The best substitute is said to be the seeds of the *Yellow water flag*, *Glad'iolus luteus* or *Iris pseudac'orus*.

Hunt's Econom'ical Break'fast Pow'der consisted of rye, roasted with a little butter.

COL'IC, Col'icus, (κολικός, from κολον, 'the colon,') (F.) Colique. Relating to the colon or to colic.

COLIC ARTERIES, Arte'riae col'icæ, (F.) Artères Coliques, are six in number, three of which, given off by the superior mesenteric, are called Colicæ dextra; and three, proceeding from the inferior mesenteric, Colicæ sinistra. All proceed towards the colon, passing between the two laminae of the peritoneum, which form the mesocolon, where they ramify and anastomose with each other. The first, Col'ica dex'tra, Ra'mus col'icus dex'ter, is called C. dex'tra super'ior, (Meso-colique,—Ch.) The second, C. dex'tra me'dia, Col'ica me'dia, Ra'mus col'icus me'dius, Arte'ria me'dia anastomot'ica, (C. droite, Ch.,) and the third, C. dex'tra infe'rior or Ileo-col'ica, (A. cécale,—Ch.) Of the three Col'icae sinis'tra, the first or super'ior is called, by Chaussier, Col'ica mag'na sinis'tra; the second or me'dia is not distinguished from the preceding, as they often arise from a common trunk; and the third is called by Chaussier Col'ica par'va sinis'tra. To these arteries as many veins correspond, which open into the great and little mesenteric.

COLIC, (κολική νόσος,) Col'ica, C. Pas'sio, Col'icë, Colicodyn'ia, Caliodyn'ia, Dolo'res intestina'rum, Do'lor col'icus, Dysenteronerv'ia, Enter'al'gia, Gripes, M'uligrubs, Bel'lyache, (Sc.) Bellythro', Weam-ill, (Prov.) Bel'lyharm, Bel'lyhawk, G'ul'ion. In its etymological acceptation, Colic signifies an affection or pain in the colon. But it is employed in a more extensive signification. It includes every acute pain of the abdomen, aggravated at intervals. The word has often, however, epithets affixed to it, which render it more or less precise. See Tormina.

COLICA CONVULSIVA, *C. Spasmodica* seu *pituitosa* seu *nervosa* seu *idiopathica*, *Enterospasmus*. Colic, not the symptom of any other affection. It is characterized by gripping pain in the bowels, chiefly about the navel, with vomiting and costiveness—the pain increasing at intervals. The indications are to clear the intestines, and allay spasm. Calomel and opium—castor oil and opium—emollient and cathartic enemata, with fomentations, wet or dry, to the abdomen, usually succeed.

COLICA CRAPULO'SA, *C. accidentalis* seu *heluo-num*, *Crapulent colic*, *Surfeit Colic* from overeating, (F.) *Colique d'Indigestion*. A colic, arising from eating indigestible aliments, or digestible aliments in too great abundance. The remedy is obvious.

Under this head is generally described the colic produced by lead, as well as the other colics mentioned in the synonymy; and they certainly resemble each other greatly, although some of them are more like bilious colic. There is not much to distinguish this variety of colic from others. The same violent pain about the navel is present, with retraction of the abdomen towards the spine. It is apt also to occasion palsy. The only difference of treatment is in the necessity for employing more opium along with the purgative. The paralytic sequelæ must be met by change of air, rubbing the spine, exercise, &c. Treating the disease upon general principles is infinitely more philosophical, and more successful than the former empirical management at *La Charité*, Paris, which it is unnecessary to detail.

The *Colic of Madrid*, of *Poitou*, *Devonshire*, *Normandy*, &c., has been called *vegetable colic*, (F.) *Colique végétale*, because ascribed to the use of new wine or cider, unripe fruit, &c., although really, perhaps, owing to the adulteration of wines and cider by litharge. All the symptoms, indeed, are those of *Colica metallica*.

In the British Pharmacopœia (1864) it is prepared of *Pyrox'ylin*, 3j; *Ether*, f3xxxvj; *Rectified spirit*, f3xij. When applied to a part, the ether evaporates, and the solid adhesive material is left, which contracts. Hence it is used in cases of wounds, to keep their edges together. It forms, also, a coating, and has been applied in abrasions, and in cases of burns. In various chronic cutaneous diseases, it has been applied with advantage; and has been employed to give a coating to pills, which it deprives of their taste, without interfering with their action.

A process for obtaining collodion is in the Ph. U. S.

The colon is usually divided into four portions. 1. The right lum'bar or ascend'ing *Co'lon dex'trum*, situate in the right lumbar region, and commencing at the cæcum. 2. [?]) (F.) *Béton*. The first milk after accouchement. It contains more serum and butter, and less casein than common milk, and seems to possess a laxative property, which renders it fit to aid in the expulsion of the meconium.

COLOUR-BLINDNESS, *Achromatopsia*.

COL'OURS, ACCIDENT'AL, *Op'posite col'ours*, *Complementary or Harmon'ic col'ours*, (F.) *Couleurs Complémentaires*. If the eye has been for some time regarding a particular colour, the retina becomes insensible to this colour; and if, afterwards, it is turned to a sheet of white paper, the paper will not seem to be white, but will be of the colour that arises from the union of all the rays of the solar spectrum, except the one to which the retina has become insensible. Thus, if the eye be directed for some time to a red wafer, the sheet of paper will seem to be of a bluish-green, in a circular spot of the same dimensions as the wafer. This bluish-green image is called an *oc'ular spec'trum*, because it is impressed upon the eye and may be retained for a short time; and the colour bluish-green, is said to be the *accidental colour of the red*. If this experiment be made with wafers of different colours, other accidental colours will be observed, varying with the colour of the wafer employed, as in the following table:—

Colour of the Wafer.	Accidental colour, or colour of the ocular spectrum.
Red.....	Bluish green.
Orange.....	Blue.
Yellow.....	Indigo.
Green.....	Violet with a little red.
Blue.....	Orange red.
Indigo.....	Orange yellow.
Violet.....	Yellow green.
Black.....	White.
White.....	Black.

If all the colours of the spectrum be ranged in a circle, in the proportions they hold in the spectrum itself, the accidental colour of any particular colour will be found directly opposite. Hence, the two colours have been termed *op'posite col'ours*. It will follow from what has been said, that if the primary colour, or that to which the eye has been first directed, be added to the accidental colour, the result must be the same impression as that produced by the union of all the rays of the spectrum—white light. The accidental colour, in other words, is what the primitive colour requires to make it white light. The primitive and accidental colours are, therefore, *com'plements* of each other; and hence accidental colours have also been called *complementary col'ours*. They have likewise been termed *harmon'ic*, because the primitive and its accidental colour harmonize with each other in painting.

It is said to have occurred in the aged, and in those that were fat and hard drinkers. In such, Dr. Traill has found a considerable quantity of oil in the serum of the blood. Vieq d'Azyr, Lair, and Dupuytren think it necessary, that the body should be placed in contact with an ignited substance. Le Cat, Kopp, and Marc are of opinion that this is not necessary. The former appears to be the more probable view.

It formerly had a more extensive signification, and still has in France. It signifies the aggregate of physical characters presented by any individual, considered with respect to his external arrangement or condition. COMPRESSEUR DE DUPUYTREN, Compressor of Dupuytren—*c. du Nez*, *Compressor nasi*—*c. de la Prostata*, *Compressor prostatae*.

COMPRESSIF, *Compressive*.

COMPRESSIO, (same etymon as *Compress*,) *Compression*, *Thlipsis*.

COMPRES'SION, *Compressio*, (same etymon.) Pressure; methodical compression. An agent frequently had recourse to in surgery. We compress a limb, affected with *œdema*, *varices*, *hydrops articuli*, *callons ulcer*, &c. The abdomen is compressed after delivery, after *paracentesis abdominalis*, &c. The compression is produced by means of the roller, laced stocking, &c., according to the part, and to the particular case. Moderate pressure aids the contractility of parts, and modifies their nutritive action; so that large tumours at times disappear after it has been used for some time. A greater degree of pressure occasions, still more, the emaciation of the part, but it is apt to impede the circulation. Pressure is often used to stop or moderate the flow of blood in cases of aneurism or wounds of arteries and veins. In such cases, the compression may be immediate, when applied upon the artery itself, or it may be mediate, when applied through the integuments and soft parts. The French use the term *Compression immédiate latérale* for that which is exerted perpendicularly to the axis of a vessel, so as to flatten its sides. It is practised with the finger, forceps, tourniquet, &c.

Methodical Compression is pressure applied *secundum artem*. *Dig'ital Compression* is pressure made by the fingers.

COMPRESSION OF THE BRAIN. This may arise either from coagula of blood, a soft tumour, a bony excrecence, a depressed portion of the skull, or the presence of some foreign body. The effects vary, according as the compression takes place suddenly or gradually. When suddenly, the symptoms are of the comatose or apoplectic character. When gradually, mania, convulsions, &c., are more likely to occur. Compression, arising from a depressed portion of skull, requires the use of the trephine.

COMPRES'SIVE, *Compress'vus*, (F.) *Compressif*. That which compresses. A *compressive bandage* is one that compresses the parts to which it is applied.

COMPRESSOR or COMPRESSORIUM OF DUPUYTREN. (F.) *Compresseur de Dupuytren.* An instrument for compressing the femoral artery, invented by Dupuytren. It is constructed on the same principles as the tourniquet of J. L. Petit, from which it only differs in this respect;—that, instead of being maintained in its place by a strap, which always compresses more or less the circumference of the limb, the two pads are placed at the extremities of a semicircle of steel, which, by passing from one to the other without touching the parts, limits the pressure to two opposite points of the thigh, and permits the collateral circulation to go on.

COMPRESSOR NA'RI'S. *Rinn'us, Nasa'lis, Transversa'lis Na'ri, Myrtiform'is, Dilato'res ala'rum na'ri, Constrictor Na'ri seu Na'rrium seu Na'ris, Triangula'ris Na'ri.* (F.) *Maxillo-narinal, Susmarillo-nasal*—(Ch.) *Compresseur du nez, Transversal du nez.* A muscle, situate at the sides of the nose; flat and triangular. It arises from the inner part of the fossa canina, and passes to the dorsum of the nose; where it is confounded with that of the opposite side.

COMPRESSOR URE'THRE. A muscle consisting of two portions—one of which is *transverse* in its direction, and, in consequence of its having been particularly described by Mr. Guthrie, has been called *Guthrie's muscle*. It arises from the ramus of the ischium, and passes inwards to embrace the membranous urethra. The other portion is *perpendicular*, descending from the pubis and passing down to be inserted into the transverse portion of the muscle;—*Pu'bio-urethra'lis*. This portion has been considered by many to be only the anterior fibres of the levator ani; and having been described by Mr. Wilson, it has been called *Wilson's muscle*.

COMPRESSOR VE'NE DORSALIS PE'NIS. A small muscle, distinctly seen in animals, less distinctly in man, which arises from the ramus of the pubis, and ascending in a direction forwards is inserted above the vena dorsalis, joining with its fellow of the opposite side on the mesial line. Its use is supposed to compress the vein in erection. It is sometimes called the *muscle of Hous'ton*, after Dr. Houston of Dublin.

The whole subject of conception is most mysterious. It seems to occur as follows. During the sexual union, the male sperm passes along the uterus and Fallopian tubes: the fimbriated extremities of the latter size hold of the ovarium; and the sperm in this manner comes in contact with a matured ovum, and impregnates it. The fecundated ovum remains some time in the ovarium, but at length bursts its covering, is laid hold of by the fimbriated extremity of the Fallopian tubes, and passes along the tube into the cavity of the uterus, where it remains for the full period of utero-gestation. Some are of opinion, that the ovum is not impregnated until it has entered the Fallopian tube, or uterus.

CON'CHA. *Conchus*, (κονχον, κορυς, 'a concave shell,') A liquid measure, amongst the Athenians, equal to half an ounce. Anatomists apply this term to several hollow parts of the body;—as the *Concha of the Ear*,—*Concha Auris, Concha Auric'ule*; (F.) *Conque*—the hollow part of the cartilage of the external ear. It has, also, been applied to the genital organs of the female; to the patella, &c.

The act of becoming thick or solid. It was once used synonymously with adhesion or growing together—as '*concretion of the toes*.' Most commonly, it is applied to extraneous and inorganic bodies, of a solid character, met with in different textures, after certain chronic inflammations; or which make their appearance in the joints or in the reservoirs for excremental fluids. *Concretion* is, therefore, frequently synonymous with *Calculus*, and is then rendered, in Latin, by the word *Concrementum*. But *Concretion* has a more extensive signification than *Calculus*; thus, accidental ossifications or deposits of phosphates of lime in certain organs, and especially in the liver and lungs, are properly called *osseous concretions*. They could not well be called *osseous calculi*.

In Surgery, it is used for the agitation often communicated to one organ by a fall upon another; as to the brain from a fall on the breech, &c.

In all severe injuries, in sudden encephalic hemorrhage, and in overwhelming emotions, a concussion or shock is felt to a greater or less extent in the nervous system, which requires the careful attention of the physician.

CONCUSSION OF THE BRAIN, *Commo'tio Cerebri*,

Apoplex'ia nervosa traumatica, *Encephaloid'mus*, (F.) *Commotio du Cerveau*, sometimes gives rise to alarming symptoms, even to abolition of the functions of the brain, yet without any sensible organic disease. Slight concussion of the brain, called *stunning*, consists in vertigo, tinnitus aurium, loss of memory, and stupefaction; all these being temporary. When more severe, there is instant loss of sensation and volition, vomiting, the patient being as if in a sound sleep, but there is no stertorous breathing. Pulse variable, generally more rapid and feeble than in compression; extremities cold. Little can be done here, till reaction has occurred: after this, the case must be treated according to general principles,—by bleeding, blisters, cold applied to the head, &c. After severe concussion, a patient, although apparently well, is not safe till some time after the accident.

Some substances are called, at times, *aliments*, and at others, *condiments*, according as they constitute the basis or the accessory to any dish: such are cream, butter, mushrooms, olives, &c. Others are always *condiments*, as they are only used to improve the savour of food, and contain little or no nutritive matter. Such are pepper, salt, cinnamon, &c. Almost all condiments are possessed of stimulant properties.

disease of the eye, which consists in the mixture of the humours. In modern times, Synchysis has been applied to a morbid state of the vitreous body, in which it is reduced to a diffuent condition. Occasionally, sparkling bodies are perceptible, which seem to be seated behind the crystalline, in the vitreous humour: hence, the disease has been called *sparkling synchysis* or *spintheropia*, (from *σπινθηρ*, 'a spark,' and *ωψ*, 'the eye;') (F.) *Spintheropie*, *Scintillement de l'œil*. *Confusio* has, also, been used synonymously with *Complexio*.

CONSTITU'TION, *Constitu'tio, Catas'tasis, Sta'tus.* A collection of several parts, forming a whole. In medicine, *Constitution* means the state of all the organs of the human body considered

in regard to their special and relative arrangement, order, or activity. A *good constitution* is one in which every organ is well developed, and endowed with due energy, so that all perform their functions with equal facility. Any want of equilibrium in their development and energy forms a difference in the constitution. We say that a man is of a *good or robust*, a *delicate or weak constitution*, when he is commonly healthy, or commonly labouring under, or unusually susceptible of, disease.

CONSTITUTION, ARTERIAL, Plethora arteriosa.

1. The *Constrictor Pharyngis inferior*, *Oriopharyngeus* and *Thyro-pharyngeus*, (F.) *Cricothyro-pharyngien*. It is broad, very thin, quadrilateral, seated superficially, extending from the thyroid and cricoid cartilages as far as the middle of the pharynx, and uniting, on the median line, with that of the opposite side. 2. The *Constrictor Pharyngis Medius*, *Hyopharyngeus* and *Chondropharyngeus*, *Syndesmo-pharyngeus*, (F.) *Hyoglossobasi-pharyngien*, occupies the middle

part of the pharynx. It is triangular, and attached anteriorly to the great and little cornu of the os hyoides; to the stylohyoid ligament; and terminates, posteriorly, by joining its fellow of the opposite side. 3. The *Constrictor Pharyngis superior*, *Cephalopharyngeus*, *Glossopharyngeus*, *Mylopharyngeus*, *Pterygopharyngeus*, (F.) *Pterygo-syndesmo-staphyli-pharyngien* is quadrilateral, and extends from the internal ala of the pterygoid process, from the inter-maxillary ligament, from the internal oblique line of the jaw, and from the base of the tongue, to the posterior part of the pharynx.

The constrictors of the pharynx contract it. They can likewise approximate the ends to each other. Chaussier considers those and the *stylo-pharyngeus* as but one muscle, and includes all under this last name.

CONSTRICTORES VAGINÆ, *C. cunni*—*c. Vulvæ*, *C. cunni*.

CONSULTATION, *Consulta'tio*, *Delibera'tio*, *Cœnolog'ia*, *Conten'tio*, *Symbolen'sis*, (*consulere*, *consultum*, 'to hold council,') This word has several acceptations. In English, it means, almost always, the meeting of two or more practitioners, to deliberate on any particular case of disease. In France, it signifies the written result of such deliberations, as well as the opinion of a physician, given to a patient, who consults him, either personally or by writing.

CONSULTING PHYSICIAN or SURGEON, (F.) *Médecin ou Chirurgien consultant*, *Consultant*. One who consults with the attending practitioner regarding any case of disease. Some physicians, surgeons, and accoucheurs confine themselves to consulting practice.

CONSUMPTION, (*consumere* (*con*, and *sumere*, *sumptum*) 'to waste away,') *Consumptio*, *Consumptio*, *Syntex'is*, *Wasting*, *Wearing*, (F.) *Consumption*. Progressive emaciation or wasting away. This condition precedes death in the greater part of chronic diseases, and particularly in *phthisis pulmonalis*: on this account it is, that phthisis has received the name *consumption*—See *Phthisis*. *Fèvre de Consumption*, *Consumptive fever*, is the same as *Hectic fever*.

CONSUMPTION OF THE BOWELS, *Enterophthisis*.

CONTABESCENTIA, (*contabescere* (*con*, and *tabescere*) 'to grow lean,') Consumption, marasmus, atrophy, &c.

CONTACT, *Contactus*, (*con*, and *tangere*, *tactum*, 'to touch,') The state of two bodies that touch each other. In the theory of contagious diseases, we distinguish *immediate or direct contact*, as when we touch a patient labouring under one of those diseases; and *mediate or indirect*

contact, when we touch, not the patient himself, but objects that have touched or emanated from him. The air is, most commonly, the medium by which this last kind of contact is effected.

CONTA'GION, *Contag'io*, *Contag'es*, *Contagium*, *Aporrhæ'a*, *Apoc'rysis*. The transmission of a disease from one person to another by direct or indirect contact. The term has, also, been applied, by some, to the action of miasmata arising from dead animal or vegetable matter, bogs, fens, &c., but in this sense it is now abandoned. Contagious diseases are produced either by a virus, capable of causing them by inoculation, as in small-pox, cow-pox, hydrophobia, syphilis, &c., or by miasmata, proceeding from a sick individual, as in plague, typhus gravior, and in measles and scarlatina. [?] Scrofula, phthisis pulmonalis, and cancer, have, by some, been esteemed contagious, but apparently without foundation. Physicians are, indeed, by no means unanimous in deciding what diseases are contagious, and what not. The contagion of plague and typhus, especially of the latter, is denied by many. It seems probable, that a disease may be contagious under certain circumstances and not under others. A case of common fever, arising from common causes, as from cold, if the patient be kept in a close, foul situation, may be converted into a disease, capable of producing emanations, which may excite a similar disease in those exposed to them. *Contagion and infection* are generally esteemed synonymous. Frequently, however, the former is applied to diseases not produced by contact; as measles, scarlet fever, [?] &c., whilst *infection*, (*Prov.*) *Smit*, is used for those that require positive contact; as itch, syphilis, &c., and conversely. Diseases which cannot be produced in any other way than by contagion, are said to have their origin in *specific contagion*; as small-pox, cow-pox, measles, hydrophobia, syphilis, &c. Those which are produced by contagion, and yet are supposed to be sometimes owing to other causes, are said to arise from *common contagion*; as typhus, cynanche parotidæa, &c.

CONTA'GIONIST, (*F.*) *Contagioniste*. One who believes in the contagious character of a particular disease,—as of yellow fever.

CONTA'GIOUS, *Contag'iosus*, (*F.*) *Contagieux*. Capable of being transmitted by mediate or immediate contact, *Communicable*,—as a contagious disease, contagious fever, contagious effluvia, &c. Commonly, the epithet *infectious*, (*F.*) *Infectieux*, (*Prov.*) *Ta'king*, *Smit'tle*, *Catch'ing*, is applied to those that are communicated by immediate contact, as itch, syphilis, &c.

CONTAGIUM, Contagion, Miasm.

A name given, metaphorically, to the structure of organized bodies; as the *texture of muscles, fibres*, &c. See *Tissue*, and *Texture*.

CONTINENS, gen. *Continen'tis*, Continent.

CON'TINENT, *Cont'inens*. Restrained. This word is synonymous, also, with *Continued*; (*F.*) *Continu*.

CONTINENT CAUSE, *Cau'sa confu'eta*, is a cause, real or presumed, which having given rise to a disease, continues to act during the whole of its duration. It may be considered synonymous with proximate cause. A *continent fe'ver*, *Fe'bris continens*, is one which preserves during its whole course, the same degree of intensity, without any remission or sensible exacerbation. A disease which continues uninterruptedly, has been also called *Æipathe'i'a*, *Acipathe'i'a* or *Aipathe'i'a*.

CONTINENTIA, Contenance.

CONTIN'UED FE'VER, *Fe'bris contin'ua* seu *continens* seu *anabat'ica* seu *assid'ua*. A fever which presents no interruption in its course. Continued fevers form a division in the class *Pyrexia* of Cullen, and include three genera,—*Synocha*, *Synochus*, and *Typhus*. It is proper to remark, that some of the older writers make a distinction between the continual fever, *συνχνης*, *fe'bris contin'ua*, and the *syn'ochus* or *fe'bris continens*. Thus, Rhases states that the *synochus* or *continens* is a fever, which consists of one paroxysm from beginning to end; whilst the *continua* is allied to intermittents.

CONTINU'ITY, *Continu'itas*. An adhesion of two things between each other, so that they cannot be separated without fracture or laceration.

CONTINUITY, **DIARTHROSES OF**, (*F.*) *Diarthroses de Continuité*, are movable joints, in which the bones are continuous, but do not touch immediately, there being between them a ligamentous substance, whose flexibility permits motion. The vertebral articulations are examples of this. **DIARTHROSES OF CONTIGUITY**, *Diarthroses de Contiguité*, on the other hand, are movable articulations, in which the bones are not continuous, but touch by surfaces covered with a cartilaginous layer, which is always moistened by synovia.

CONTINUITY, **LESION OF**, see *Continuity*, solution of.

CONTINUITY, **SOLU'TION OF**, *Solu'tio contin'uit*, is any division of parts, previously continuous. Wounds and fractures are *solutions of continuity*. The word *Continuity* is opposed to *Contiguity*: the latter meaning the condition of two things which are near each other, or touch without uniting. There is *contiguity* between the head of the humerus and the glenoid cavity of the scapula, but not *continuity*.

A *le'sion of continuity*, *Le'sio contin'uit*, is a destruction of continuity caused by disease.

An incision, made in the most depending part of a wound or abscess, when the first opening is not situate in a manner favorable for the discharge of the pus.

CONTRAC'TILE, *Contract'ilia*, (*contrahere*, (*con*, and *trahere*, *tractum*,) 'to draw together,') Capable of contracting. The fibre of muscles is *contractile*.

CONTRACTILITÉ, Contractility—c. *par Dé-faut d'Extension*, Elasticity—c. *de Tissu*, Elasticity.

CONTRACTILITY, *Contractilitas*, (F.) *Contractilité*. That vital property, which gives, to certain parts, the power of contracting. The muscles of locomotion are endowed with a power of *voluntary contractility*, or one dependent immediately on the action of the brain:—the muscles of the viscera of digestion, and other internal organs, enjoy an *involuntary contractility*. *Contractility* and *irritability* are frequently used synonymously to signify the property possessed by any tissue of *contracting* on the application of an appropriate stimulus.

CONTRACTILITY, Irritability.

CONTRACTIO, *Contractio*—c. Cordis, Systole.

CONTRACT'ION, *Contract'io*, *Systole*. Action of contracting. When we speak of the *contraction of a muscle*, we mean the phenomenon it exhibits during the time it is in action.

A state of permanent rigidity and progressive atrophy of the flexor muscles, which prevents the motions of extension beyond a certain limit. The affected muscles form hard cords beneath the skin. On dissection, they are found converted into tendinous fibres, the fleshy fibres having almost disappeared, when the disease has been of any duration. It frequently succeeds other diseases, particularly rheumatism, neuralgia, convulsions, syphilis, colica pictorum, &c. The warm bath, vapour bath, or thermal waters, oleaginous embrocations, mechanical extension of the limbs, &c., are the chief means of treatment.

CONTRAEXTENSIO, Counterextension.

A fracture, contusion, or injury, produced, by a blow, in a part distant from that which is struck. Five species of *contrafissura* or *contre-coups* may occur in the skull. 1. When the internal table yields and fractures. 2. When the bone breaks in any other part than the one struck. 3. When a bone, which has been struck, remains uninjured, and its neighbour is fractured. 4. When the bone is fractured in a place diametrically opposite to that struck, as in fractures at the base of the cranium, from a fall on the vertex; and lastly, when the violence of the blow produces a separation of the neighbouring or distant sutures. These fractures of the skull are also called *Fractures par résonnance*.

CONTROSTIMULANT, *Contrastim'ulans*, *Hyposthen'ic*, (F.) *Hyposthe'nique*, (*contra*, and *stimulus*, 'that which excites.') A substance that possesses a particular, debilitating property, acting upon the excitability in a manner opposite to stimulus. A name given to therapeutical agents, which, according to the Italian theory of *contrastimulus*, are endowed with the property of diminishing excitement by a specific action. These agents are by no means clearly defined.

CONTROSTIMULUS or **CONTRASTIMULUS**, DOCTRINE OF, (F.) *Contrastimulisme*. Same etymon. The name given by Rasori, half a century ago, to a new medical doctrine, of which he was the originator—*La nuova Dottrina Medica Italiana*. It is founded on the *contro-stimulant*—*Rasorian*—property attributed to a certain number of medicines. In this doctrine, as in that of Brown, under the name *excitability* a fundamental principle of physiology is admitted, by virtue of which living beings are endowed with an aptitude for feeling the action of external agents or exciting influences, and of reacting on these influences. When this excitability is too great, there is excess of stimulus or *Hypersthen'ia*: when too little, there is deficiency or *Hyposthen'ia*. Diseases, *general* and *local*, are divided into three great classes, or into, 1. *Hypersthen'ic*; 2. *Hyposthen'ic*; 3. *Irritative*. The *contro-stimulant* physicians admit only two classes of medicines—*stimulants* and *contro-stimulants*.

(Same etymon as *Contunding*.) An injury or lesion—arising from the impulse of a body with a blunt surface—which presents no loss of substance, and no apparent wound. If the skin be divided, the injury takes the name of *contused wound*. The differences of contusions, as to extent, are of course infinite. When slight, the blood stagnates in the capillaries of the skin, or is effused into the subcutaneous areolar tissue. Time and cold applications remove it. When the texture has been lacerated, there is effusion of blood, with more or less torpor in the part affected. Cooling applications, general or topical bleeding, emollients, poultices, &c., are here necessary, according to circum-

stances. In the severest kinds of contusion, all the soft and solid parts, except the skin, are bruised, and, at times, reduced to a kind of pap. When the disorganization is to this extent, there is no hope except in amputation. A deep contusion of the soft parts has been called *Sarcothlasia*, and *Sarcothlasma*.

CONTUSION, WIND, see Wind of a Ball.

CONTUSUS, Contused.

CONUS ARTERIOSUS, ('arterial cone,') *Infundibulum* of the heart. The portion of the right ventricle from which the pulmonary artery proceeds, forms a prominence on the right side of the anterior furrow of the heart, and is prolonged towards the left, becoming narrower at the same time, so as to form a funnel-shaped projection, which extends a little beyond the base of the ventricles. This is the *Conus arteriosus*.

It is in very hard, concentric layers; covered, externally, by a species of porous bark full of cellulæ, each of which contains one of these animals. Linnæus calls the red coral *Pais nobilis*, and M. de Lamarck, *Corall'ium rubrum*. It is much fished for on the coasts of Barbary and Sicily. It contains gelatin, albumen, chloride of sodium, phosphate, carbonate, and sulphate of lime, carbonate of magnesia, silica, oxide of iron, and a colouring principle. CORIUM PHLOGIS'TICUM, *Crusta pleuritica* seu *inflammatoria* seu *phlogistica*, *Peg'min*, *Inflammatoria Crust* or *Buff*, *Buffy Coat*, (*F.*) *Couenne*, *C. Pleuritique*, *C. Inflammatoire*. The grayish crust or buff, varying in thickness, observed on blood drawn from a vein during the existence of violent inflammation, pregnancy, &c. It is particularly manifest in pleurisy, and hence one of its names. For its production, it appears to be requisite that there should be an increase in the proportion of the fibrinous element of the blood over that of the red corpuscles, with augmented aggregation of those corpuscles. The blood is then longer in coagulating, and the red corpuscles have time to subside. In highly inflammatory conditions, the buffy coat assumes a concave appearance on its upper surface, and the blood is, therefore, said to be *cupped*. Polli gave to the coagulative substance the name *brad'gyl'brin*. It is the ordinary fibrin of the blood,—the only self-coagulable ingredient in it.

When the blood presents the above appearance, it is said to be *buffy* or *sizey*.

CORN, (from *cornu*, 'a horn,') *Ola'eus*, *Ola'eus Pe'dis*, *Ecphy'ma Ola'eus*, *Gemur'sa*, (*F.*) *Cor*, *Ognon*. A small, hard, corneous tumour, which forms upon the foot, generally on the toes; and is commonly produced on the most projecting parts by the pressure of too tight shoes. A part of the corn is raised above the skin, and forms a round tumour, like the head of a nail: the other portion, which serves as its base, is buried more or less deeply in the integuments, and occasionally extends as far as the tendons and periosteum. Corns may, sometimes, be removed, by immersing the feet in warm water, but commonly they return. They can, likewise, be destroyed by the knife or caustic, or by paring them down and pulling them out by the roots; but these operations are not always as simple as they seem. In the way of palliation, they must be constantly pared; and for the purpose of preventing pressure, any soft plaster, spread upon linen or leather, may be applied, with a hole in the centre to receive the corn; and layer after layer of plaster be added, until they attain the level of the corn. When very irritable, lunar caustic, rubbed over the surface, will generally diminish irritability surprisingly, and in a mode not easy of explanation.

The transparent cor'nea. (F.) *Cornée*. One of the coats of the eye, so called because it has some resemblance to horn. It is termed transparent to distinguish it from the opake—*Cornea opa'ca* or *Sclero'tic*. It is convex, anteriorly; concave, posteriorly; forming nearly one-fifth of the anterior part of the eye, and representing a segment of a sphere, about seven lines and a half, or in. 0.625 in diameter. Hart'shorn Jel'ly may be made as follows:—*Hartshorn shavings*, 3vj; boil in water Oiv to Oij; strain, and add, whilst hot, of lemon-juice, two tablespoonfuls; white sugar, 3vj; and *Sherry wine*, two glasses. A good nutriment for the sick, where wine is not improper.

When burnt, the shavings constitute the *Cor'nu cer'vi calcina'tum*, *Cor'nu us'tum*, *Phos'phas Cal'cis*, *Calca'ria phosphor'ica*, (F.) *Corne de cerf*

calcinée, *Phosphate de chaux*, which consists of 57.5 per cent. of phosphate of lime. It has been used as an antacid, but is wholly inert, as its composition would indicate. It contains only 1 per cent. of carbonate of lime.

Phosphate of lime has also been given in osteomalacia, from a presumption that the disease is owing to a deficiency of earthy matter in the blood, which is doubtless an error—the fault being in the agents of assimilation or the cells of nutrition. With as little propriety, it has been proposed as an excitant to the healthy action of the cells in tuberculosis.

Bone earth is usually sold in the shops for burnt hartshorn.

The British Pharmacopœia (1864), and the Pharmacopœia of the United States, have a *Cornu Phosphas Precipitata*, *Precipitated Phosphate of Lime*, prepared by dissolving burnt *os bones* in *muratic acid*, and precipitating by *solution of ammonia*. The dried precipitate, called *bone phosphate of lime*, has no virtues not possessed by the *cornu ustum*.

The posterior pyramids—*fasciculi graciles*—are described as distinct from the restiform bodies. They are situate in contact with each other, one on each side of the posterior median fissure. They become closely applied to the restiform bodies, and have been considered to be blended with them, and to proceed to form the cerebellum. According to some, they ascend to the cerebrum.

CORPORA STRIATA, *Eminentiæ Lenticula'res, Colliculi Ner'ei Ethmoïda'lis, Apices Oru'rum medull'æ oblongat'æ, Ganglion cer'e'br'i ant'erior, Ant'erior cer'e'bral ganglion.* (F.) *Corps striés, Grand ganglion supérieur du cerveau* (Gall), *Couches des nerfs ethmoïdaux, Corps cannelés.* Pyriform eminences of a slightly brownish-gray colour, which form part of the floor of the lateral ventricles of the brain. When cut, a mixture of gray and white substances is seen, arranged alternately, to which they owe their name. The tract of fibres that ascends from the anterior pyramids passes chiefly into them. Willis considered that the soul resided there.

CORPUS, gen. *Cor'poris*, *So'ma*, *Bod'y*. Any object which strikes one or more of our senses. Gases, liquids, metals, vegetables, animals, are so many bodies. Natural bodies have been divided into animal, vegetable, and mineral; or into inorganic, including the mineral kingdom; and organized, including the animal and vegetable. The chief differences between organized and inorganic bodies consists in the former having an origin by generation, growth by nutrition, and termination by death; the latter a fortuitous origin, external growth, and a termination by chemical or mechanical force.

Many parts of the frame have, also, been distinguished by this name, as *Corpus Callosum*, *C. Mucosum*, &c. See *Body*, and *Corpora*.

A white, medullary band, perceived on separating the two hemispheres of the brain, which it connects with each other. La Peyronie regarded it as the seat of the soul. On it are seen longitudinal and transverse fibres—*Stri'æ longitudinales Lancis'ii*, (see *Raphe*.) and *Stri'æ seu Chor'dæ transversales Willis'ii*. The anterior portion, which bends downwards, is termed *genu*; the posterior flexure, *sple'nium*, *tuber*, (F.) *bourrelet*. The fibres which curve backwards into the posterior lobes from the posterior border of the corpus callosum, have been termed *Forceps*; those which pass directly outwards into the middle lobes from the same point, *Tape'tum*; and those which curve forwards and inwards from the anterior border to the anterior lobe, *forceps anterior*.

A central, oval nucleus, of cineritious substance, met with in the cerebellum; the circumference of which exhibits a number of indentations, surrounded by medullary substance. It is seen by dividing the cerebellum vertically into two equal parts.—The same body has been called *Corps cendré* ou *ciliaire* ou *rhomboïde*, *Corpus Cinereum seu Rhomboïdeum seu Rhomboidalz*, *Ganglion du cervelet*, *Noyau central des Pédoncules du cervelet*, *Nu'cleus dentatus seu fimbriatus seu centr'al'is seu rhomboida'lis*, *Substan'tia rhomboïdea*, *Ganglion cilia'rè*, *G. cerebell'i*. The term *Corpus dentatum*, *Nu'cleus oliv'æ*, is also given to the ganglion of the corpus olivare, which, like that of the cerebellum, is a yellowish-gray dentated capsule, open behind, and containing medullary matter, from which a fasciculus of fibres proceeds upwards to the corpora quadrigemina and thalami optici.

CORPUS LU'TEUM, (F.) *Corps jaune*, 'yellow body.' *Ovariale*, *Oâriale*. A small yellowish body perceived in the ovary, and left after the rupture of one of the vesicles. It was, for a long time, considered an evidence of previous impregnation; but *Corpora lutea* are met with in unquestionable virgins; although the corpora lutea of virgins have been generally regarded to differ materially, in size and character, from those of impregnation, which have been called *true corpora lutea* in contradistinction to the other, called *false corpora lutea*.

CORPUS MUCO'SUM, *C. reticulatè*, *Re'tè muco'sum*, *Mucus* seu *Re'tè* seu *Stratum Malpighii*, *Reticulum cutaneum* seu *muco'sum*, *Mesodermum*, *Mucosa* web, (F.) *Corps muqueux*, *Couche de Malpighi*. The second layer of the skin has been so called. It is situate between the *cutis vera* and *cuticle*, and gives colour to the body. In the white varieties of our species it is colourless; in the negro, black. By most anatomists the existence of such a layer, distinct from the epidermis, is denied.

It then proceeds to the end of the corpora cavernosa, and terminates in the glans penis, which it forms. Where the urethra enters the bulb, it is surrounded by a layer of erectile tissue, called, by Kobelt, *Colliculi bulbi*. Kobelt describes, in the female, as the analogue to the corpus spongiosum of the male, a venous plexus, which, as it lies between the glans clitoridis, and the part that corresponds, in the male, to the bulb of the urethra, he terms *pars intermedia*, (F.) *Réseau intermédiaire*.

tion, bodies are perceptible, which were first described by Wolff, as existing in the fowl, and in the mammalia by Oken. According to Müller, they disappear in man very early, so that but slight remains of them are perceptible after the 9th or 10th week of pregnancy. They cover the region of the kidneys and renal capsules, which are formed afterwards; and they are presumed to be the organs of urinary secretion during the first periods of foetal existence.

They appear, however, to have been depicted in 1741 by Lehmann, from a preparation by A. Vater, who called them *Papille* and *P. nervæ*. Hence, it has been proposed by J. C. Strahl (1848) to call them *Vaterian corpuscles* or *Corpuscles of Vater* (*Vater'sche Körperchen*.) Small bodies connected with the cutaneous nerves of the palm and sole. They have also been found sparingly and inconstantly in nerves at the wrist and elbow, the upper arm, fore-arm, and thigh, and in the inter-costal nerve, the sacral plexus, solar plexus and the plexuses adjacent to it. In each corpuscle there is the termination of a nervous filament. Their uses are not known.

The gray portion observed at the exterior of the cerebrum and cerebellum; so called because it forms a kind of bark to the medullary substance. Gall considers, that this substance forms the nerves; and therefore calls it *Substance matrice des Nerfs*.

The name *cortical* is likewise given to the external substance of the kidneys, because it is of a deeper colour than the inner part of the organ, and forms a kind of envelope to it.

CORTEX MUSENÆ, see *Rottlera Schimperi*.

CORTEX O'VI, *Cor'tical mem'brane*. This membrane, so called by Boer and Granville, is usually regarded as a uterine production, and designated *Decid'ua reflex'a*. They consider it to surround the ovule, when it descends into the uterus, and

to enclose the shaggy chorion. It is absorbed during the first months of utero-gestation, so as to expose the next membrane to the contact of the decidua, with which a connexion takes place at the part where the placenta is to be formed. In that part, Boer and Granville consider, that the Cortex Ovi is never altogether obliterated, but only made thinner, and in process of time is converted into a mere pellicle or envelope, which not only serves to divide the filiform vessels of the chorion into groups or cotyledons, in order to form the placenta, but also covers those cotyledons. This, Dr. Granville calls *membra'na pro'pria*. See *Decidua membrana*.

Words introduced, since Gall, into medical language. (The first two terms are respectively derived from *cranio*, *λογος*, 'a discourse,' and *σκοπεω*, 'to examine.') They signify a description, or simply an examination, of the different parts of the external surface of the cranium, in order to deduce from it a knowledge of the different intellectual and moral dispositions. Strictly speaking, it is by *Cranioscopy* or *Organoscopy* that we acquire a knowledge of *Craniology*, *Organology*, or *Cranology*, as it has been variously termed. These words are generally, however, used in the same sense. The cranium being moulded to the brain, there are as many prominences on the bone as there are projections at the surface of the brain. According to Gall, each projection, which he calls an *organ*, is the seat of a particular intellectual or moral faculty, and all persons endowed with the same faculty, have, at the same part of the brain, a prominence, which is indicated, externally, by a bump or projection in the bony case. The *System* of Gall is made to comprise 27 prominences, which answer to 27 primary faculties.

A fundamental principle with the *Cranialogists* or *Phrenologists* is,—that the brain does not act as a single organ, but that it consists of a plurality of organs; but, were we able to admit this, the assignment of the seat of different faculties could not but be considered premature.

These bones are eight in number,—the *frontal*, *occipital*, two *parietal*, two *temporal*, the *sphenoid*, and *ethmoid*. Besides these, there might be considered, as belonging to the cranium, the *cornua sphenoidalia*, the bones of the ear, and the *Wormiana*. Dr. Pritchard has described the primitive forms of the skull according to the width of the *Breg'ma*, or space between the parietal bones: 1. Some mean by *crisis* of a disease, when it augments or diminishes considerably, becomes transformed into another, or ceases entirely. Some have used the word to signify only the favourable changes which supervene in disease; others, for the change going on in the acme or violence of the disease. Others, again, have given this name only to a rapid and favourable change, joined to some copious evacuation or eruption; whilst others have applied the term to the symptoms that accompany such change, and not to the change itself;—thus including, under the same denomination, the critical phenomena and the *crisis*.

CRITICAL DAYS, *Dies Crit'ici* seu *Judicator'ii* seu *Decreto'rii* seu *Prin'cipis* seu *Radica'les* seu *Contempla'biles* seu *Internun'cii*, (F.) *Jours critiques*, are those on which a crisis, it is imagined, is most likely to happen. According to Hippocrates and Galen, the greatest number of fevers terminate favourably on the 7th day; and many on the 14th;—these two days being the most propitious. Next to these come, in order of efficiency, the 9th, 11th, 20th or 21st, 17th, 5th, 4th, 3d, 18th, 27th, and 28th. The sixth day was called, by Galen, the *Tyrant*, *τυραννος*, because the crises that happened then were generally unfavourable. After this, the most unfavourable were the 8th, 10th, 12th, 16th, and 19th. The 13th was a sort of neutral day; the crises which happened on it being neither favourable nor unfavourable. Days were, also, divided into *Inter'calary*, on which the crises happened less frequently, and were less complete than on the *critical* or *indicatory*;—and into *vacant* and *non-dec'retory*, on which a crisis hardly ever occurred. According to this division, they were enumerated as follows:—

Critical days.....7th, 14th, 20th, 27th, 34th, 40th, 60th, &c.

Indicatory days.....4th, 11th, 17th, 24th, &c.

Intercalary days.....3d, 5th, 6th, 9th, &c.

Non-dec'retory days....2d, 8th, 10th, 12th, 13th, &c.

Fortunate crises were considered to be indicated by favourable signs appearing three days before.

CRURÆAL, Triceps crûris.

CRURÆAL ARCH, *Inguinal* or *Fem'oral Arch*, (F.) *Arcade crûræale ou inguinale*, (Ch.), *Poupart's Ligament*, L. of *Fallo'pian*. This arch is formed by the internal portion of the inferior edge of the aponeurosis of the obliquus externus muscle, which is attached, at one end, to the pubis; at the other, to the anterior and superior spinous process of the ilium. At its posterior and inner part, the aponeurosis, forming the arch, sends off a falciform reflection, which is attached along the crest of the pubis, and is known under the name of GIMBERNAT'S Ligament. Beneath this arch, the vessels, nerves, and muscles make their exit from the pelvis to the thigh.

CRURÆAL ARTERY, *Ar'teria Crûræalis*, *Fem'oral Ar'tery*, (F.) *Artère crûræale*, is the continuation of the external iliac. It extends from the crural arch to the aperture in the triceps, or to the ham. Chaussier applies the name *Artère crûræale* to the trunk, which extends from the primitive or common iliac to the tibial arteries—embracing, of course, the external iliac, femoral, and popliteal.

CRURÆAL CANAL, *Crûral Ring*, *Fem'oral canal* or *ring*. M. Jules Cloquet has described this canal with minuteness, and given it the name *Anneau crûral*, *Anneau fémoral*. It is nearly an inch long, triangular, more spacious above than below, and shorter and broader in the female than in the male. Its upper orifice is bounded, anteriorly, by the crural arch; posteriorly, by the crista of the pubis; on the outer side by the psoas and iliacus muscles, covered by the iliac aponeurosis, and, at the inner, by Gimbernat's ligament. This orifice is covered by the peritoneum, and, according to M. Cloquet, is closed by a more or less resisting septum, which he has named *Septum crûræale*, *Crûral Septum*. In its course, the crural canal has its anterior parietes formed by the superficial expansion of the fascia lata: the posterior by the pectineus, covered by the deep-seated expansion of the fascia; and more externally by the psoas and iliacus muscles, covered by an expansion of the fascia iliaca. Its inferior orifice is formed by the foramen of the fascia lata, which gives passage to the vena saphæna. It is at the upper orifice of this canal, that *Fem'oral* or *Crûral Hernia*, *Hernie inguinale* of Chaussier, occurs; which would be more common, were it not for the fibrous cellular septum there situate.

CRURÆAL NERVE proceeds from the lumbar plexus, and is situate at the outer side of the psoas muscle and crural artery. After it has passed under the crural arch, it divides into cutaneous and muscular branches. One of the branches, which is larger than the rest, is called the *Saphæna nerve*. It gives off filaments to the integuments of the knee, to the inner part of the leg, and to the dorsal surface of the foot. The remainder of the branches of the crural are distributed to the anterior and inner part of the thigh. The *Ac'cessory of the Crûral Nerve* is a term given to the 4th and 5th pairs of lumbar nerves.

CRURÆAL PLEXUS of Chaussier is the union of the anterior branches of the last four pairs of lumbar nerves, and the first four sacral; forming the lumbar and sacral plexuses of most anatomists.

crural of the French, or of the *Trifemorotulien* of Chaussier. The crural is situate at the anterior, outer, and inner part of the thigh. It arises, fleshy, from between the two trochanters, adheres firmly to most of the fore part of the os femoris, and is inserted, tendinous, into the upper part of the patella, behind the rectus. Its use is to assist the vasti and rectus in the extension of the leg. Under *Muscle Triceps Crural*, the French describe the cruralis and the two vasti. Some small muscular slips, sometimes found under the cruræus muscle, and inserted into the capsular ligament of the knee-joint, have been called *Sub-cruræi*.

CUBITAL ARTERY, *Arte'ria cubita'lis*, *A. ulna'ris*, arises from the humeral a little below the bend of the elbow; proceeds along the anterior and inner part of the forearm; passes anterior to the ligamentum annulare of the carpus, and goes to form, in the palm of the hand, the superficial palmar arch. Besides the numerous muscular branches, which it gives off in its course, it sends posteriorly the common trunk of the *interosseous arteries*, and internally, the two *cubital recurren'ts*, anterior and posterior,—articular branches, which anastomose on the inside of the elbow with the divisions of the humeral artery.

The lancets are placed in such a manner in the scarificator, that, when it is applied upon the affected part, the whole are, by means of a spring, forced suddenly into it. After scarification, the cupping-glass, which has been previously exhausted by heat, or by an exhausting syringe, is applied. The pressure of the air within the glass being thus diminished, the necessary quantity of blood may be drawn. See *Bellometer*. *Dry cupping*, *Cucurbit'ula sic'ca*, is the application of the glasses, *dry cups*, (F.) *Ventouses sèches*, without previous scarification. It is used to prevent the activity of absorption from any wounded part; occasionally, to excite suppuration in indolent abscesses; and to remove the pus when an abscess is opened. *Cupping*, without any epithet, means the abstraction of blood by means of the scarificator and cups:—(F.) *Ventouses scarifiées*, (L.) *Cucurbit'ulae eruct'ae*, *C. cum Fer'ro*, *Wet cup'ping*, or *Wet Cups*, *Cut Cups*. This, as usually met with, is in masses, difficult to break; not deliquescent; foliaceous; of a fine bluish-green colour, and salt taste. It is tonic, emetic, escharotic, and detergent; but scarcely ever employed internally. Chiefly used in detergent ointments. Dose, as a tonic, under $\frac{1}{2}$ gr.: emetic, from gr. j to gr. ij. Powdered verdigris appears to be the active ingredient in *Smellome's Eye-salve*, which may be imitated by rubbing half a drachm of finely-powdered verdigris with a little oil, and then mixing it with an ounce of yellow basilicon.

An ointment composed of one drachm of finely-powdered verdigris, with an ounce of lard or spermaceti ointment, is used in psoriasis, tetter, &c.

Sulfate de Cuivre, Cuivre bleu*, is in rhomboidal, rich, blue, semi-transparent, efflorescing crystals. The taste is harsh, styptic, and corrosive. It is soluble in four parts of water at 60°, and is tonic, emetic, astringent, and escharotic. As a tonic, it has been used in epilepsy, intermittents, &c. Dose, as a tonic, gr. $\frac{1}{2}$ to gr. ij, in pill; as an emetic, gr. ij to x, in water. In its metallic state, it exerts no action on the system. When swallowed, it undergoes no deleterious change. Copper cannot be dissolved whilst tin is in the mixture, and hence the utility of tinning copper vessels. Copper culinary vessels are harmless under ordinary cleanliness, provided the substances be not suffered to remain in them till cold. The salts of copper are very deleterious.

Wrap the ammoniated copper in bibulous paper, and dry with a gentle heat. Keep in a well-stopped glass bottle.—Ph. U. S.) A crystalline powder of a rich violet colour, and hot, styptic taste. By exposure to air, it becomes partly converted into carbonate of copper. It is tonic and astringent, and has been chiefly employed in epilepsy, and other obstinate spasmodic diseases. Dose, gr. $\frac{1}{2}$ gradually increased to gr. iv, in pill.

CUPRUM VITRIOLATUM, *Cupri sulphas*.

It is said to be obtained from the bark of a species of convolvulus, called *Vejneo de Moenure*, but is referred by Martius to *Strychnos Guianensis*, and by Dr. Schomburg to *S. toxicaria seu toxicifera*. The juice of *Echites anberetia*, another apocynaceous plant, is said to enter into its composition. Dr. Brainard thinks it contains the venom of serpents as its main ingredient. Two new varieties of Curare have been investigated by Dr. Hammond of the United States Army, and Dr. S. W. Mitchell,—*carrocal* and *vio*,—the latter of which is less energetic, but both appear to contain the same active alkaloid—*carrocalina*. They seem to be of vegetable origin, and to contain no trace of the venom of serpents.

CUTANEOUS EXHALATION AND ABSORPTION are those which take place from the skin.

CUTANEOUS, MIDDLE POSTERIOR, see Sciatic nerve, lesser.

CUTANEOUS NERVES, *Cuta'neal Nerves* so called, of the upper extremity, are two in number. They are given off from the brachial plexus. The *internal cutaneous*, *Cubito-cutané*—(Ch.,) descends along the inner part of the arm, and divides above the elbow into two branches; the outermost of which follows the outer edge of the biceps, and spreads over the anterior and inner part of the forearm; and the innermost accompanies the basilic vein, passing to the corresponding side of the hand and little finger. The *external cutaneous*, *Radio-cutané* (Ch.,) *Mus'culo-Cuta'neus*, *Per'forans CASSE'RI*, passes outwards; perforates the coraco-brachialis; descends along the anterior and outer part of the arm; passes as far as the middle fold of the elbow under the median cephalic; and descends along the anterior and outer edge of the forearm. At some distance above the wrist, it divides into two branches; an *outer*, which is distributed on the back of the hand, the thumb and index finger; and an *inner*, which descends on the muscles of the thumb into the palm of the hand, and divides into fine filaments, which may be traced to the fingers.

Cutaneous nerves, *Mid'dle cuta'neous*, two in number, are branches of the crural or femoral nerve. They are distributed to the integument of the middle and lower part of the thigh and of the knee.

Nervus Cuta'neus M'ior, *Lesser inter'nal cuta'neous nerve*, *Nerve of Wris'berg*, takes its origin from the axillary plexus, but is more particularly connected with the ulnar nerve. It soon separates from the ulnar, running afterwards between it and the inner side of the arm. A little below the axilla it divides into two branches, which are distributed to the arm.

Chaussier calls the *cephalic* and *basilic veins* the *Ra'dial* and *Cu'bial Cuta'neous*.

A dense, resisting membrane, of a flexible and extensible nature, which forms the general envelope of the body; and is continuous with the mucous membranes, through the different natural apertures. It is generally considered to be formed of three distinct layers—the *epidermis*, *rete*, or more properly *corpus mucosum*, and *corium* (*cutis vera*, *derma*). Some anatomists, however, separate it into several others. Its outer surface is covered by a number of small eminences, called papillae, which are generally regarded as essentially nervous and vascular. The skin is a medium of communication with external bodies. It protects the subjacent parts; is the seat of touch; and through it are exhaled the watery parts of the blood, which are not needed in the nutrition of the body. The state of the skin, as regards heat and dryness, affords useful information in pathological investigations. Its colour, too, requires attention: the paleness of disease is as characteristic as the rosy complexion of health. The colour of the skin varies according to the age, sex, &c. As a general rule, it is finer in the female and child than in the male and adult. In old age it becomes light-coloured, thin, and dry. It likewise varies according to races, &c.

A disease in which the surface of the body is coloured blue. It is often symptomatic, and commonly depends on a direct com-

munication remaining between the cavities of the right and left side of the heart; *Patency of the foramen ova'le*, *Atelectocardie* of Piorry. Such communication does not, however, always occasion the *blue disease*, but it is generally thought that the disease never exists without this state of parts; or without some obstacle to the circulation in the right side of the heart. The blueness does not seem to be owing to the admixture of black and red blood. A child affected with blueness is said to be *cyano'sed*, (F.) *Cyanosé*.

Inflammation of the supradiaphragmatic portion of the alimentary canal, and of the lining membrane of the upper part of the air-passages:—(F.) *Angine*, *Esquinancie*, *Mal de Gorge*, *Synancie*, *Squinancie*, *Kinancie*. It comprises the following chief varieties.

CYNANCHE EPIDEMICA, *Cynanche maligna*—c. *Externa*, *C. Parotidea*—c. *Fauccium*, *C. tonsillaris*—c. *Gangrenosa*, *Cynanche maligna*—c. *Laryngea*, *Laryngitis*.

CYNANCHE MALIG'NA, *C. gangrenosa* seu *epidemica* seu *purpuroparotidea* seu *ulcerosa*, *Cucocynanché*, *Pharyngocacé*, *Cacopharyngia*, *Fébris epidemica cum Angina*, *Empresma Paristhmia* *Malig'na*, *Tonsillarum gangrenosa*, *Tonsillæ pestilentes*, *Epidemica gutturis lues*, *Pestilens faucium affectus*, *Pedanchoné* [?], *Gangrenosa Tonsillarum*, *Ulcus Syriacum*, *Morbus Syriacus seu suffocatus seu suffocans*, *Garotillo*, *Carbunculus anginosus*, *Angina ulcerosa seu ulcusculo* seu *epidemica seu gangrenosa seu maligna seu faucium maligna*, *Isthmophus*, *Putrid* or *Ulcerous Sorethroat*, *Gangrenous Inflammation of the Pharynx*, (F.) *Angine gangréneuse ou Maligne*. It is characterized by crimson redness of the mucous membrane of the fauces and tonsils; ulcerations, covered with mucus; and spreading sloughs, of an ash or whitish hue; the accompanying fever typhus. It is often epidemic, and fancied to be contagious [?]; and is frequently found accompanying scarlet fever,—giving rise to the variety, *Scarlatina maligna*, *Canker rash*. *Cynanche maligna* has been made to include both diphtheritic and gangrenous pharyngitis. See *Pharyngitis*, *diphtheritis*.

The general treatment is the same as in typhus; and stimulant antiseptic gargles must be used, consisting, for example, of the decoction of bark and muriatic acid, a solution of chlorate of potassa, &c.

CYNANCHE MAXILLARIS, c. *Parotidea*—c. *Œsophagea*, *Œsophagitis*.

CYNANCHE PAROTIDEA, *C. Parotidis* seu *exter'na* seu *maxillaris*, *Empresma Parotidis*, *Parotitis*, *P. epidemica* seu *erysipelato* seu *contagio* seu *spuria* seu *serosa glutinosa tumens*, *Parotia*, *Parotiditis*, *Angina maxillaris* seu *exter'na* seu *parotidea exter'na*, *Gisa*, *Erythrochæras*, *Gengyocynanché*, *Gnathocynanché*, *Inflammatio parotidum*, *Inflatio parotidum*, *Catar'rhus Bellinulæ*, *Mumps*, *Branks* (Scotch), (F.) *Inflammation de la Parotide*, *Oreillons*, *Ourles*. The characteristic symptoms are:—a painful tumor of the parotid gland, or of the areolar tissue surrounding it, or of both, not of the suppurative kind; frequently extending to the maxillary gland. It is very conspicuous externally, and is often accompanied with swelling of the testis in the male, and of the mammae in the female; the testes being sometimes absorbed afterwards. It is generally epidemic, and apparently contagious. [?] The treatment is very simple; the adoption merely of the antiphlogistic plan, under which it usually soon disappears. When inflammation of the mammae or testes supervenes, it must be treated as if idiopathic.

Epidemic Parotitis or *Mumps* is also termed *Parotitis polymorpha* seu *epidemica* seu *specificæ*.

CYNANCHE PHARYNGEA, *Empresma Paristhmia* *Pharyngea*, *Isthmia*, *Pharyngitis*, *Inflammatio Pharyngis*, *Parasyanché*, *Angina inflammatoria*, *Sp. iv. of Boerhaave*, (F.) *Angine Pharyngée*, *Catarrhe pharyngien*. Inflammation of the pharynx.

This disease can hardly be said to differ, in pathology or treatment, from *Cynanche tonsillaris*. The same may be remarked of *Cynanché Œsophagea*, *Œsophagitis*.

CYNANCHE PRUNELLA, *C. Tonsillaris*—c. *Purpuro-parotidea*, *Cynanche maligna*—c. *Simplex*, *Isthmitis*—c. *Stridula*, *C. trachealis*.

CYNANCHE TONSILLARIS, *C. faucium* seu *Prunella*, *Empresma Paristhmia* *Tonsillarum*, *Synanché*, *Amygdalitis*, *Branchi*, *Branchi*, *Hyanché*, *Tonsillitis*, *Tonsillia*, *Squinanthia*, *Paristhmia*, *Paristhmia*, *Dysphagia inflammatoria*, *Antidiitis*, *Angina inflammatoria* seu *cum tumore* seu *tonsillarum* seu *synochalis* seu *sanguinea* seu *vera et legitima*, *Inflammatio Tonsillarum*, *Antidionem inflammatorium*, *Inflammatory Sorethroat*, *Common Squinancy*, *Squin'zey*, *Squin'ey* or *Quin'ey*, (Old E.) *Stenosis*, *Squinancie*, (F.) *Amygdalite*, *Inflammation des Amygdales*, *Angine tonsillaire*, *Pharyngite tonsillaire*, *Esquinancie*, *Squinancie*, *Catarrhe guttural*, *Angine gutturale inflammatoire*. The characteristic symptoms of this affection are, swelling and florid redness of the mucous membrane of the fauces, and especially of the tonsils; painful and impeded deglutition, accompanied with inflammatory fever. It is generally ascribed to cold, and is one of the most common affections of cold and temperate climates. It usually goes off by resolution, but frequently ends in suppuration.

Common sore throat is an affection of no consequence. It requires merely rest, and the observance of the antiphlogistic regimen. When more violent,—in addition to this,—bleeding, local or general, or both,—purgatives, inhalation of the steam of warm water; acid, or emollient gargles; rubefacients externally, or sinapisms or blisters. When suppuration must inevitably occur, the continued use of the inhaler must be advised, and an opening be made into the abscess as soon as pus shall have formed. If the patient be likely to be suffocated by the tumefaction, bronchotomy may be necessary.

CYNANCHE TRACHEALIS, *Cynanché laryngea* of some, *C. stridula*, *Suffocatio stridula*, *Asthma infantum*, *Catar'rhus suffocatus Barbadoensis*, *Angina polyposa* seu *membranacea* seu *pulposa* seu *perniciosa* seu *inflammatoria* seu *suffocatoria* seu *strepitosa* seu *canni* seu *exsudatoria* seu *trachealis*, *Empresma bronchitis* seu *bronchlemmitis*, *Laryngitis* et *Tracheitis infantilis*, *Laryngitis exsudativa* seu *membranacea* seu *polyposa*, *Laryngostasis* seu *Laryngotracheitis*, *Laryngotracheitis* with *diphtheritic exudation*, *Laryngocacé*, *Orthopnea cynanchica*, *Cynanchorthopnea*, *Pedanchoné* [?], *Morbus Strangulatorius*, *Trachitis*, *Tracheitis*, *Trachelitis*, *Tracheop'gra*, *Trachealia*, *Diphtheritis trachealis*, *Expectoratio Solida*, *Cann'a Bronchitis*, *Croup*, *Roup*, *Hives*, *Bold Hives*, *Choak*, *Stiffing*, *Rising of the lights*, (F.) *Angine laryngée et trachéale*, *Laryngite avec production de fausses membranes*, *Laryngite pseudo-membraneuse*. A disease characterized by sonorous and suffocative breathing; harsh voice; cough, ringing, or like the barking of a dog; fever, highly inflammatory. It is apt to be speedily attended with the formation of a false membrane, which lines the trachea beneath the glottis, and occasions violent dyspnoea and suffocation, but is sometimes expectorated. The dyspnoea, as in all other affections of the air-passages, has evident exacerbations. It differs in its character in different situations; being infinitely more inflammatory in some than in others,

and hence the success obtained from different modes of treatment. It chiefly affects children, and is apt to recur, but the subsequent attacks are usually less and less severe.

As a general rule, it requires the most active treatment; bleeding from the arm or neck, so as to induce paleness; leeches applied to the neck, &c., according to the age,—the warm bath, blisters to the neck or chest, and purgatives. Formidable as the disease may be, if this plan be followed early, it will generally be successful. Many specifics have been recommended, but the search has been idle and fruitless. The majority of cases of what are called croup are not of this inflammatory cast; but are more of a spasmodic character, and have been termed by the French *faux croup*, *false croup*, and with us are occasionally termed *spasmodic croup*. They generally yield to an emetic and the warm bath.

A name given to the second covering of the testicle, which the ancient anatomists conceived to be muscular, but which is merely areolar. Its external surface is towards the scrotum; the internal towards the tunica vaginalis. They are narcotic and poisonous; are given internally as narcotics and antispasmodics; and applied externally as sedatives, in the form of fomentation. The seeds are smoked like tobacco, in asthma. The dose of the powder is, gr. j to gr. viii.

The seeds have been regarded as stomachic, carminative, and diuretic; but they have little efficacy. The seeds of the wild plant are, by some, preferred to those of the garden.

Where there is reason to suppose that a woman feigns herself pregnant, a writ *de ventre inspiciendo* may be issued to determine whether she is so or not. Definitive cessation of all the functions, the aggregate of which constitute life. *Real Death*, *Apothanasia*, is distinguished from *asphyxia* or *apparent death*—the latter being merely a suspension of those same functions. But it is often difficult to judge of such suspension, and the only certain sign of real death is the commencement of putrefaction. At times, therefore, great caution is requisite to avoid mistakes. Death is commonly preceded by some distressing symptoms, which depend on lesion of respiration, circulation, or of the cerebral functions, and which constitute the *agony*. That which occurs suddenly, and without any, or with few, precursory signs, is called *sudden death*. It is ordinarily caused by disease of the heart, apoplexy, the rupture of an aneurism, or by some other organic affection. Death is *natural*, (Sc.) *Stras-death*, when it occurs as the result of dis-

ease: *violent*, when produced by some forcible agency. It may likewise affect the whole body, or a part only; hence the difference between *somatic* and *molecular* death.

The chief varieties of the modes of death usually admitted may be thus given:

Death beginning at the heart,	{ sudden — Syn-
	cope: gradual —
	Asthenia.
“ “ in the lungs	— Apnoea.
“ “ in the brain	— Apoplexy.
“ “ in the gray matter of the	{ Paralysis of
medulla,	pneumogastries,
“ “ in the blood [?]	&c.
	— necræmia.

As it was at one time conceived, with Bichat, that death must commence in the heart, lungs, or brain, these organs were called *atria mortis*, 'the halls of death.'

DEATH, APPARENT, Asphyxia.

DEATH, BLACK, *Melanothan'atus*, *Pes'tis n'gra*, *Black Plague*, (F.) *Peste noire*. The plague of the 14th century was so called, which is supposed to have proved fatal in Europe to 25,000,000 of people.

DEBILITANTS, *Debilitan'tio*, *Antidynam'ica*, *Philadynam'ica*, (*debilitare*, itself from *debilis*, quasi *dehabilis*, 'weak,' 'to weaken.') Remedies exhibited for the purpose of reducing excitement. Antiphlogistics are, hence, debilitants.

DEBILITAS, gen. *Debilitat'is*, Debility—d. Erethisica, see Irritable—d. Nervosa, Neurasthenia, see Irritable—d. Visûs, Asthenopia.

DEBILITY, *Debilit'as*, *Astheni'a*, *Hypostheni'a*, *Blac'a*, *Anenerge'sia*, *Anenergi'a*, *Weakness*, (F.) *Faiblesse*. A condition, which may be induced by a number of causes. It must not be confounded with *fatigue*, which is temporary, whilst debility is generally more permanent.

Debility may be *re'al*, or it may be *appa'rent*; and, in the management of disease, it is important to attend to this. At the commencement of fever, for example, there is often a degree of apparent debility, which prevents the use of appropriate means, and thus is the cause of much evil. Excitement is more dangerous than debility.

DÉBOITEMENT, (*de*, and *boiter*, 'to be lame,') Luxation.

DEBORDEMENT (F.), *Déborde*, (*déborder*, 'de, and border,') 'to overflow.') A popular term for one or more sudden and copious evacuations from the bowels. It is chiefly applied to bilious evacuations of this kind.—*Débordement de Bile*.

DÉBRIDEMENT (F.) *Frano'rum solu'tio*, (*débrider*, (*de*, and *brider*,) 'to unbridle.') The removal of filaments, &c., in a wound or abscess, which prevent the discharge of pus. In a more general acceptation, it means the cutting of a soft membranous, or aponeurotic part, which interferes with the exercise of any organ whatever; thus, in paraphimosis, *débridement* of the prepuce is practised to put an end to the inflammation of the glans; in strangulated hernia, *débridement* of the abdominal ring is had recourse to, to remove the stricture of the intestine, &c.

DECIDUA, Decidua membrana.

DECID'UA MEMBRA'NA, *Decid'ua*, *Decid'uons Mem'brane*. So called on account of its being considered to fall off from the uterus at parturition. A membrane, formerly defined to be the outermost membrane of the fetus in utero; and still so defined by some—as by Dr. Lee. Chaussier calls it *Epicho'rion*; by others, it has been called *Perio'na*, *Membra'na cadu'ca Hunteri*, *M. flocculen'ta seu cellul'o'sa seu sinuo'sa seu commu'nis seu præxis'tens*, *Decid'ua exter'na seu spon-gio'sa*, *Tu'nica exte'rior o'vi seu cadu'ca seu cras'sa*, *Membra'na cribro'sa seu o'vi mater'na seu mu-co'sa seu u'teri intern'a evolu'ta*, *Epio'nê*, *Placen'ta u'teri succenturia'tus*, *Subplacen'ta*, *Nidamen'tum*, *Anhis'tous mem'brane*, (F.) *Caducue*, *C. vraie*, *Membrane caduque*, *Epione*, *Périone*;—prior to the time of the Hunters, called *Cho'rion spongio'sum*, seu *tomento'sum seu fungo'sum seu reticula'tum*, *Tu'nica filamento'sa*, *Shag'gy Cho'rion*, *Spon'gy Cho'rion*, &c. Great diversity has prevailed regarding this membrane and its reflected portion. It exists before the germ arrives in the uterus—and it has been met with in tubal and ovarian pregnancies; and is occasioned by a new action, assumed by the uterine vessels at the moment of conception. Chaussier, Lobstein, Gardien, Vel-peau, and others, consider it to be a sac, without apertures, completely lining the uterus, and that when the ovum descends through the tube it, pushes the decidua before it, and becomes envel-

oped in it, except at the part destined to form the placenta. That portion of the membrane which covers the ovum, forms the *Membrana decidua reflexa*, (F.) *Caducue réfléchie*, *Membrane caducue réfléchie*, according to them; the part lining the uterus being the *Decidua uteri*, (F.) *Caducue utérine*. Towards the end of the fourth month, the decidua reflex disappears. The very existence of a *Tunica decidua reflexa* has, however, been denied. This last membrane has received various names. Dr. Granville, regarding it as the external membrane of the ovum, has termed it *Cor'tex o'vi*. It has also been termed *Involu'crum membrana'cum*, *Membrana retiform'is cho'rii seu filamento'sa seu adcentil'ia seu cras'sa*, *O'culine* and *Decidua protrusa*. To the membrane which, according to Bojanus and others, is situate between the placenta and the uterus, and which he considers to be produced at a later period than the decidua vera, he gave the name *membrana decidua sero'tina*, (F.) *Membrane utéroëpichoriale Caducue sérotine ou secondaire*.

Histological researches seem to show, that the decidua is an altered condition of the lining membrane of the uterus, with a whitish secretion filling the uterine tubular glands. The decidua reflexa is probably formed by the agency of nucleated cells from the plastic materials thrown out from the decidua uteri; in the same manner as the chorion is formed in the Fallopian tube from plastic materials thrown out from its lining membrane. That the decidua reflexa is not a mere inverted portion of the decidua uteri is shown by the fact, that the texture of the two is by no means identical.

DECIDUA PROTRUSA, Decidua reflexa.

DECIDUOUS MEMBRANE, Decidua (membrana).

DEC'IGRAMME, *Decigram'ma*, (*decimus*, 'the tenth part,' and *γρᾶμμα*, 'gramme.') The tenth part of the gramme in weight; equal to a little less than two grains, French; 1.543 Troy.

DECLAMATION, *Declama'tio*, (*de*, and *clamare*, *clamatum*, 'to cry out.') The art of depicting the sentiments by inflections of the voice, accompanied by gestures, which render the meaning of the speaker more evident, and infuse into the minds of the auditors the emotions with which he is impressed. Declamation may become the cause of disease; the modification, produced in the pulmonary circulation,—accompanied by the great excitement, sometimes experienced,—is the cause of many morbid affections; particularly of pneumonia, hæmoptysis, and apoplexy. In moderation, it gives a healthy excitement to the frame.

DÉCLIN, Decline.

operation of boiling certain ingredients in a fluid, for the purpose of extracting the parts soluble at that temperature. Decoction, likewise, means the product of this operation, to which the terms *Decoc'tum*, *Zé'ma*, *Aphep'se'ma*, *Ap'ozem*, *Apoz'e'ma*, *Heps'e'ma*, *Chyl'us*, and *Eps'e'ma*, (F.) *Décocté*, *Hydro'lé*, *Hydro'lite*, have been applied according to ancient custom, in order to avoid any confusion between the operation and its product;—as *præpara'tio* is used for the act of preparing; *præpara'tum*, for the thing prepared.

DELETERIUM, *Poison*.

DELHI BOIL. An inveterate cutaneous affection, prevalent at Delhi, in India, which assumes the form of a boil, and may, afterwards, ulcerate, forming the *Delhi ulcer*. It is called, there, *Arungzebe*, owing to the emperor of that name having died with it. The treatment is chiefly local, and consists of the ordinary eutrophic ointments. Eutrophics may, also, be given internally.

DELHI ULCER, see *Delhi Boil*.

DELIERET, *Delirious*.

DELIGATIO, *Deligation*, *Ligature*, see *Bandage*.

DELIGA'TION, *Deliga'tio*, *Epid'e'is*, *Deligatu'ra*, *Vul'nerum deliga'tio* seu *vinctu'ra*, *Fascia'tum*, *Applica'tio*, *Plaga'rum Vincitu'ra*, *Fascia'tio*, (from *deligare*, *deligatum*, (*de*, and *ligo*,) 'to bind,') The deligation of wounds formerly embraced the application of apparatus, dressings, &c,—the denomination *Deliga'tor Plaga'rum* being synonymous with *Med'icus Vuln'era'rius*, and in derivation, with the *Wundarzt*, 'wound physician' or surgeon, of the Germans. Deligation is hardly ever used now as an English word. In France, it is applied to the regular and methodical application of bandages, and to the ligature of arteries, and, occasionally, in the latter sense, with *us*.

DELIGATURA, Deligation.

DELIQUESCENT, *Deliques'cent*, (*delinescere*, (*de*, and *liquesce*), 'to melt,' 'to dissolve.') Any salt which becomes liquid by attracting moisture from the air. The deliquescent salts require to be kept in bottles, well stopped. Chloride of lime, acetate of potassa, and carbonate of potassa, are examples of such salts. The ancient chemists expressed the condition of a body, which had become liquid in this manner, by the word *Deliquium*.

DELIQUIUM ANIMI, (*delinquere*, *delictum*, 'to leave.') Syncope.

DELIRAMENTUM, Delirium.

DELIRANS, Delirious.

DÉLIRANT, Delirious.

That which is attended by delirium. The French use the term *Fièvre pernicieuse délirante* for a febrile intermittent, in which delirium is the predominant symptom.

DELIRIUM, (perhaps, from *de*, and *lira*, 'a ridge between two furrows': more probably from *de*, and *ληρη*, 'a silly saying or action.') *Parac'opé*, *Phren'i'tis*, *Phledou'ia*, *Desipien'tia*, *Aphros'yné*, *Paralere'ma*, *Paralere'sis*, *Paralog'ia*, *Phanta'sia*, *Paraphros'yné*, *Emo'tio*, *Le'ros*, *Parano'a*, *Alloph'asis*, *Delira'tio*, *Delirament'um*, (Sc.) *Ra'very*, *Ro'ving*, (F.) *Délire*, *Égarment d'esprit*, *Transport*, *Idéosynchysie*, &c. Straying from the rules of reason; wandering of the mind. Hippocrates used the word *pavia*, *mania*, for *delir'ium en'né fe'bre*, and the Greek words given above for *delir'ium cum fe'brē*. In different authors, also, we find the words, *Paraph'ora*, *Paraphren'sis*, *Paraphren'ia*, *Phren'e'sis*, *Phrenet'asis*, &c., for different kinds of delirium. Delirium is usually symptomatic.

A state of delirium and agitation,—often termed 'the horrors'—peculiar to those addicted to spirituous liquors, with great sleeplessness. It is preceded by indisposition, lassitude, watchfulness, headache, and anorexia; the delirium and tremors, *Tremor potato'rum*, most commonly recurring in paroxysms. It is caused by the habitual and intemperate use of ardent spirits or of opium or tobacco; or by abandoning them after prolonged use. The treatment is various. Many have regarded stimulants, with large doses of

opium to induce rest, to be indispensable. It is certain, however, that the expectant system will often, if not generally, be successful; and, it is probable, a cure effected in this manner will be more permanent than when produced by excitants.

DELIRIUM SENILE, see Dementia—*d. Tremifaciens*, *D. tremens*.

DELIVERY, Parturition—*d. False*, *False water*.

DÉLIVRANCE (F.). An expression, which, in common language, signifies the action of delivering, *libera'tio*, but in the practice of obstetrics means the extrusion of the secundines, either spontaneously or by the efforts of art. This completion of delivery—*par'tus secundo'rius*, *secundina'rum expul'sio* seu *extra'ctio*—is produced by the same laws as the expulsion of the fetus. Sometimes, the after-birth follows the child immediately; at others, it is retained; and requires manual interference to remove it. The following are the chief cases in which it has been practised. 1. Intimate adhesion between the placenta and paries of the uterus. 2. Spasmodic contraction of the orifice of the uterus. 3. Hour-glass contraction. 4. Torpor or hemorrhage after the expulsion of the child, and,—5. Insertion of the placenta at the orifice of the uterus.

DÉLIVRE, Secundines.

S.) have the same property as those of *Stavesacre*.

DELPHINIUM CONSOLIDA, Delphinium—*d. Segetum*, Delphinium.

DELPHINIUM STAPHISAGRIA. The systematic name of the *Stavesacre*, *Staphisagria*, *Phtheiroctonum*, *Phthe'rium*, *Sta'phis*, *Pedicula'ria*, (F.) *Staphisaig'ra*, *Herbe aux Poux*, *Dauphinelle*. The seeds, *Staphisa'gria*, (Ph. L. and E.) have a disagreeable smell; a nauseous, bitterish, hot taste; and are cathartic, emetic, and vermifuge: owing, however, to the violence of their operation, they are seldom given internally, and are chiefly used in powder, mixed with hair powder, to destroy lice. An alkaloid of this plant has been separated, and received the name of *Delphin'ie*, *Delphia*, (F.) *Delphine*, *Delphinine*. It is extremely acrid, and has been recently used, like veratrina, in tic douloureux, paralysis and rheumatism. It is used in the form of ointment, or in solution in alcohol, (gr. x to xxx, or more, to ʒi.) applied externally.

DELPHINIUM VERSICOLOR, Delphinium.

DELPHYS, (*delph'is*), Uterus, Vulva.

DELTA, (like the Greek letter Δ,) Vulva.

DELTOID, *Delta'ides*, *Delto'ides*, *Deltoid'eus*, *Deltiform'is*, (F.) *Deltoid'e*, (*delta*, Δ, and *αἶος*, 'resemblance,') *Sous-acromio-clavi-huméral* of Dumas; *Sous-acromio-huméral* of Chaussier. A triangular muscle forming the fleshy part of the

shoulder, and covering the shoulder-joint. It extends from the outer third of the clavicle, from the acromion and spine of the scapula to near the middle and outer part of the os humeri, where it is inserted by means of a strong tendon. This muscle raises the arm directly upwards, when the shoulder is fixed, and carries it anteriorly or posteriorly, according to the direction of the fibres, which are thrown into action. If the arm be rendered immovable, the deltoid acts inversely and depresses the shoulder.

DELTOIDE, Deltoid.

DELUSION, (*de*, and *ludere*, *lusum*, 'to play,') Hallucination.

In common parlance, and even in legal language, this word is synonymous with insanity. Physicians, however, have applied it to those cases of unsound mind which are characterized by a total loss of the faculty of thought, or by such an imbecility of intellect that the ideas are extremely incoherent, there being at the same time a total loss of the power of reasoning. Mania and melancholy are apt to end in this, if possible, more deplorable state. *Do'tage* is the Dementia of the aged—*Mo'ria de'mens lere'ma*, *Lere'ma*, *Lere'sis*, *Le'rus*, *Delir'io Se'nem*, *Amen'tia Sen'il'is*, *Pueril'itas*, *Delir'ium Sen'il'e*, *Anil'itas*, *Sen'ile Insan'ity*, *Sen'ile Dement'ia*, *Insan'ity of the aged*, (Sc.) *Doitrie*,—a form of insanity, in which there is a hopeless decadency or loss of the mental faculties.

Medicines supposed to be capable of correcting certain acrid conditions imagined to exist in the humours. Substances of a mucilaginous or saccharine nature belong to this class. Demulcents may act directly on the parts with which they come in contact; but in other cases, as in catarrh, their effect is produced by contiguous sympathy; the top of the larynx being soothed by them first, and indirectly the inflamed portion of the air-passages. In diseases of the urinary organs, they have no advantage over simple diluents.—See Diluents and Emollients. The following are demulcents:—*Acacia Gummi*; *Althææ Folia et Radix*; *Amygdale*; *Amylum*; *Avenæ Farina*; *Cera*; *Cetaceum*; *Cydoniæ Semina*; *Fucus Crispus*; *Glycyrrhiza*; *Hordeum*; *Lichen*; *Linum*; *Olivæ Oleum*; *Sassafras Medulla*; *Sesamum*; *Sevum*; *Tragacantha*, and *Ulmus*.

A disease, which first appeared in the years 1827 and 1828, in the West Indies, and in the southern states of North America. It was extremely violent in its symptoms, but not often fatal. It usually commenced with great languor, chilliness, and pain in the tendons about the smaller joints. To these symptoms succeeded burning heat and redness of the skin, pains in the muscles of the limbs or in the forehead, with vomiting or nausea. The fever continued for one, two or three days, and usually terminated by copious perspiration. In different places, it put on different appearances; but seems in all to have been a singular variety of rheumatic fever. The usual antiphlogistic treatment was adopted, and successfully.

DENTIT'ION, *Teeth'ing*, *Dentit'io*, *Dentit'is*, *Odontoph'ia*, *Odont'asia*, *Odonto'sis*, (*dentire*, *dentitum*, 'to breed teeth.') The exit of the teeth from the alveoli and gums; or rather the phenomena which characterize the different periods of their existence. The germs of the first teeth, *dentes laci* or *milk teeth*, (F.) *dents de lait*, are visible in the fetus about the end of the second month; and they begin to be ossified from the end of the third to that of the sixth month. At birth, the corona of the incisors is formed, but that of the canine is not completed; and the tubercles of the molares are not yet all united. Gradually, the fang becomes developed; and at about six or eight months begins, what is commonly called, the *first dentit'ion*, *Odont'ia dentitio'nis lactantium*. The two middle incisors of the lower jaw commonly appear first; and, some time afterwards, those of the upper jaw; afterwards, the two lateral incisors of the lower jaw; and then those of the upper, followed by the four anterior molares; the *canine*, or *eye-teeth*, at first, those of the lower, and, afterwards, those of the upper jaw, next appear; and, subsequently and successively, the first 4 molares—2 above and 2 below, 1 on each side. The whole number of the *primary, temporary, deciduous, shedding or milk-teeth*, (*dentes temporarii*) (F.) *Dents de lait*, is now 20.

The eruption of the milk teeth takes place, approximately, in the following order:

Central incisors.....	6th to 8th month.
Lateral incisors	7th to 10th month.
First molar	12th to 14th month.
Canines.....	15th to 20th month.
Second molar	20th to 30th month.

The *second dentit'ion* or *shedding of the teeth*, *odont'ia dentitio'nis puerilis*, *Dedentit'ion*, begins about the age of 6 or 7. The germs or membranous follicles of these second teeth—to the number of 32—as well as the rudiments of the teeth themselves, are visible, even in the fetus, with the exception of those of the small molares, which do not appear till after birth. They are contained in alveoli of the same shape as those of the first dentition. Their ossification commences at from 3 to 6 months after birth, in the incisors and first molares; at eight or nine months, in the canine; about three years, in the molares; 3½ in the second great molares, and about 10 years in the last. As the alveolus of a new tooth becomes gradually augmented, the septum between it and that of the corresponding milk tooth is absorbed, and disap-

pears. The root of the milk tooth is likewise absorbed; its corona becomes loose and falls out, and all the first teeth are gradually replaced by the *permanent teeth*, *Dentes serotini*. This second dentition becomes necessary in consequence of the increased size of the jaws. The new teeth have neither the same direction nor the same shape as the old; and they are more numerous, amounting until the age of 25, (sooner or later,) to 28. About this period, a small molar appears at the extremity of each jaw, which is called *wis'dom tooth*, *wis't tooth*, *Dens sapien'tia* seu *serotinus* seu *sophroret'icus* seu *sophronis'tus* seu *sophronis'ter* seu *opi'gonus*, *Ops'idous*, (F.) *Arrière dent*, *Dent de sagesse*, making the whole number of permanent teeth 32.

The eruption of the permanent teeth is remarkable for its general regularity; so that it constitutes an important means for ascertaining the age of the individual during the early period of life.

First molars.....	7th year.
Central incisors	8th year.
Lateral incisors.....	9th year.
First bicuspid.....	10th year.
Second bicuspid.....	11th year.
Canines.....	12th year.
Second molars	13th year.

The teeth of the lower jaw generally precede by a few weeks those of the upper.

During the period of dentition, that is, of the first dentition, the infant is especially liable to disease;—the irritation, produced by the pressure of the tooth on the superincumbent gum, sometimes occasioning pyrexia, convulsions, diarrhoea, &c., which symptoms are often strikingly relieved by a free division of the distended gum. This disordered condition is called *Teeth'ing*, *Odont'ia dentitio'nis*, *Odont'asia*, *Odontal'gia dentitio'nis*, *Odaxis'mus*.

Depilatories are usually caustic applications, in which quicklime or some other alkaline substance, sulphuret of iron, &c., enter.

DEPILATORY, COLLEY'S, seems to consist of quicklime and a portion of sulphuret of potassa.

Delcroix's depilatory, and *Plencé's depilatory*, have a similar composition. They all, probably, contain arsenic, in the form of orpiment. The following formula has been given for that of Colley: quicklime, 30 parts; soap lees, 125 parts; sulphur, 4 parts; nitre, 4 parts; orpiment, 12 parts. Another depilatory by F. Boudet is formed of sulphuret of sodium, 3 parts; quicklime, in powder, 10; starch, 10; mix. Rub a little of this powder with water; apply it to the part, and remove the hair in a minute or two with a wooden knife. Dervault recommends the *Depilatory of Martins*, which is a sulphuretted sulphuret of calcium; made by passing sulphohydric acid into quicklime to saturation. A little of this is applied to the part, and in eight or ten minutes it becomes solid. It must then be washed off with cold or hot water, when the skin will be found denuded. Another, given by Redwood, is a strong solution of the sulphuret of barium, made into a paste with starch powder. It is used like the one advised by Boudet. Those that do not contain arsenic are, of course, safer.

* A pitch plaster, *Pitchcap*, *Dro'pax*, is sometimes used as a depilatory. It of course pulls the hair out by the roots. Depilation by it has been termed *Dropacismus*, *Pisso'sis*, *Pitto'sis*, *Picacismus*, and *Picatio*.

rhœ'a, *Dip'sacus*, *Diarrhœ'a in Uri'nâ seu uri-nos'a*, (F.) *Diabète*, *Flux d'Urine*. A disease characterized by great augmentation, and often manifest alteration in the secretion of urine; with excessive thirst and progressive emaciation. Cullen has described two species:—*Diabètes insip'idus* and *D. Mellitus*; the former, (F.) *Diabète faux ou insipide*, *Diabète* being, simply, a superabundant discharge of limpid urine, of its usual, urinary taste; the latter, *D. Mellitus*, called, also, *Paru'ria Mellita*, *Diabètes Au'glicus seu ce'rus*, *Melitu'ria*, *Melithyperu'ria*, *Glucosu'ria*, *Glycyrrhœ'a urino'sa*, *Uroze'mia mellita*, *Saccharorrhœ'a urino'sa*, *Phthi'u'ria*, *Urophthi'sis*, *Ta'bes diaret'ica seu diab'etica*, *Dyspep'sia saccharig'ena*, *Apo-ceno'sis Diab'etes Mellitus*, *Sac'charine diab'etes*, (F.) *Diabète sucré*, *Hyperuorrrhœe saccharine*, *Phthiuric sucrée*,—falls under the definition given above. The quantity of urine, discharged in the 24 hours, is sometimes excessive, amounting to 30 pints and upwards; each pint containing sometimes 24 oz. saccharine matter. This replaces the urea, which is not found in quantity in the urine of those laboring under diabetes. Where the disease is situate is not clear. The whole system of nutrition, however, seems to be morbidly implicated. A part of the urine must be formed at the expense of the system, as the egesta frequently far exceed the solid and liquid ingesta. On dissection, no morbid appearance is met with sufficient to enable us to fix on the seat of this distressing affection.

All the remedies that have been tried have usually been found insufficient in *D. Mellitus*.

D. insip'idus, *Hyperure'sis aquo'sa*, *Hydru'ria*, *Hydrure'sis*, *Paru'ria incon'tinens aquo'sa*, *Diab'etes spu'rius*, *Urorrhœ'a*, *U'real Diab'etes*, (F.) *Polyuria*, *Hyperuorrrhœe*, *Diabète insipide*, *Faux diabète*, which occurs in hysterical habits, and has, hence, been called *D. hyster'icus*, is of comparatively trifling moment. Exclusive diet, and attention to the state of the cutaneous transpiration, which have sometimes produced good effects in *D. Mellitus*, have most commonly failed.

They arise from the upper part of the abdominal aorta, or from the coeliac artery, and divide into two principal branches, which are distributed on the lower surface of the diaphragm and in its substance.

They arise from the second and third nerves of the cervical plexus, about the middle of the neck, and receive two or three filaments from the brachial plexus, after which they descend into the chest at the sides of the pericardium, and are distributed to the diaphragm.

DIAPHRAGMATIC PLEX'USES are two in number; one right, and the other left. They arise from the upper part of the solar plexus, by a small number of branches, which are distributed to the diaphragm, following exactly the branches of the inferior diaphragmatic arteries.

The terms, *Paraphren'itis* and *Paraphren'is* have been obtained from the Peripatetic philosophy, which supposed the seat of the *φρων* or soul to be the præcordia. The essential symptoms of diaphragmitis are:—painful constriction around the præcordia, with small, quick, laborious breathing. It is a rare disease.

A disease characterized by frequent liquid alvine evacuations, and generally owing to inflammation or irritation of the mucous membrane of the intestines. It is commonly caused by errors in regimen, the use of food noxious by its quality or quantity, &c., constituting the *Diarrhœa stercora'ria*, *D. Crapulo'sa* of writers. It may be acute or chronic. Many varieties have been made by some nosologists—e. g. mucous,—*Diarrhœa muco'sa*, *Blennoche'zia*, *Blennoche'zia*, *Mycodiarrhœa*; bilious,—*Reo-cholo'sis*, *Cholodiarrhœa*, *Diarrhœa bilio'sa*; serous,—*Hydroche'zia*, *Hydrodiarrhœa*, *Orrhoche'zia*; dependent upon the matters evacuated. Diarrhœa requires different treatment, according to its nature. If caused, as it often is, by improper matters in the intestinal canal, these must be evacuated; and the astringent plan of treatment must not be adopted, unless the discharges seem kept up by irritability of the intestines, or unless they are colligative. The indiscriminate use of astringents is to be deprecated.

A very fatal diarrhœa prevails amongst the native inhabitants of India, to which Mr. Tytler has given the name *Diarrhœa hec'tica*, because, like hectic fever, it seems to obtain habitual possession of the constitution, to operate upon it with scarcely any perceptible intermission, and in general, to defy the most powerful remedies.

The day is, properly, the period during which the solar light illumines our horizon; but commonly, also, we designate by the word *day* the period of 24 hours, *Nycthe'meron*, which is frequently divided into four parts—morning, midday, evening, and midnight. In antiquity, great importance was attached to the observation of days in disease. The medical day is usually reckoned at 24 hours,—universally, in estimating the duration of a disease. In parts of the United States, it comprises only the time when the sun is above the horizon, as regards the administration of medicine, so that if a medicine be ordered to be taken four times a day, it is understood to mean during the 12 hours of day.

Originally, this word signified nearly the same thing as *Hygiene* and *Regimen*,—that is, Diet was the employment of every thing necessary for the preservation of health and life. At the present day, it usually signifies a particular kind of food and drink. Also, abstinence:—to put any one upon diet, (F.) *mettre quelqu'un à la diète*, means to deprive him of his usual nourishment. The terms *milk diet*, *Die'ta lac'tis*,; *flesh or meat diet*, *Die'ta car'nis*; *soup or broth diet*, *Die'ta ju'ris vel jus'culi*, &c., explain themselves. See *Aliment*, *Hygiene*, and *Regimen*.

Every large hospital, military or civil; every prison and eleemosynary institution of every kind, has certain dietetic regulations, and many of them have *Tables of Dietary* or *Diet Scales*, which are more or less implicitly followed. See *Diet*.

The Diet Scale of the British Navy allowed from 31 to 35½ ounces of dry nutritious matter daily; of which 26 ounces were vegetable, and the rest animal—9 ounces of salt meat, or 4½ ounces of fresh. That of the Navy of the United States has been as follows:—*Three days in the week*—Pork, 16 oz.; beans or peas, 7 oz.; biscuit,

14 oz.; pickles or cranberries, 1 oz.; sugar, 2 oz.; tea, ½ oz.;—*40½ oz. Two days in the week*—Beef, 16 oz.; flour, 8 oz.; fruit, dried, 4 oz.; biscuit, 14 oz.; tea and sugar, 2½ oz.; pickles or cranberries, 1 oz.;—*45½ oz. Two days in the week*—Beef, 16 oz.; rice, 8 oz.; butter, 2 oz.; cheese, 2 oz.; biscuit, 14 oz.; tea and sugar, 2½ oz.; pickles or cranberries, 1 oz.;—*45½ oz.* The daily Diet allowance to the British soldier has been one pound of bread, and three-quarters of a pound of meat. In the Army of the United States, the quantity of beef, salt or fresh, issued per day, is a pound and a quarter; of pork or of bacon, three-quarters of a pound. Ordinarily, the soldiers have fresh meat four days in the week, and salt meat the other three days; but every diet scale is subject to mutations in the individual articles. It must combine, however, a due admixture of nitrogenized, nonnitrogenized, and inorganic materials. See *Aliment*. The treatise of Dr. Pereira on 'Food and Diet,' and the Treatise on Hygiene by Dr. W. A. Hammond, of the United States Army, 1863, contain numerous Dietaries, civil and military. See, also, *Ration*.

It is an important part of Hygiene. A well regulated system of diet has great power in checking disease, and likewise in preventing it. A proper knowledge of dietetics is, indeed, as important as that of the *Materia Medica*, strictly so called.

Dietetics has been used, also, synonymously with Hygiene.

DIGAS'TRICUS, (*di*, and *γαστήρ*, 'a belly,') *Biven'ter*, *B. Maxil'lar*, *Dep'rimentu Maxil'lar Biven'ter*, *Bigas'ter*, (F.) *Mastoidohygénien*, *Mastoidogénien*—(Ch.), *Digastrique*, *Abaisseur de la mâchoire inférieure*. The name *Digastrius* was formerly given to several muscles. It is now restricted to one of the muscles of the superior hyoid

region. The digastricus is thick and fleshy at its extremities, thin and tendinous at its middle. It is attached to the mastoid groove of the temporal bone, and to a fossette at the side of the symphysis menti. Its tendon passes through an aponeurotic ring, which is attached to the os hyoides.

The use of the digastricus is to depress the lower jaw, or to raise the os hyoides, and to carry it forwards or backwards, as in deglutition.

The strong double-bellied muscle, which forms the gizzard of birds, is also called *Digastricus*.

DIGESTIBLE, (*digestus, digestum*, 'to digest,' and *habilis*, 'able,') *Concoctus habilis*. Capable of being digested. All food is not equally digestible, and some of the most important is the least so:—the fat of meat, for example. Certain substances, again, are entirely rebellious. As a general rule, albuminous aliments—as tender mutton and beef, are the most easily appropriated.

DIGESTIF, Digestive.

DIGESTIO, Digestion—d. Depravata, Dyspepsia—d. Difficilis, Dyspensia—d. Læsa, Dyspepsia.

DIGESTION. *Digestio*, (from *digere*, *digestum*, 'to digest;') *Coc'tio*, *C. Cibo'rum*, *Pep'sis*, *Digestio Proc'ess.* Digestion is a function, by means of which alimentary substances, when introduced into the digestive canal, undergo different alterations. The object of it is to convert them into two parts; the one, a reparatory juice, destined to renew the perpetual waste occurring in the economy; the other, deprived of its nutritious properties, to be rejected from the body. This function is composed of a series of organic actions, differing according to the particular organization of the animal. In man they are eight in number, viz.: 1. Prehension of food. 2. Mastication. 3. Insalivation. 4. Deglutition. 5. Action of the stomach. 6. Action of the small intestine. 7. Action of the large intestine. 8. Expulsion of the feces.

DIGESTION is also a *pharmaceutical* operation, which consists in treating certain solid substances with water, alcohol, or other menstruum, at a slightly elevated temperature, — in a sand-bath, for example, or by leaving them exposed for some time to the sun.

Scrophularineæ. *Sex. Syst.* Didynamia Angiospermia. (F.) *Digitale*, *Gants de notre dame*, *Doigtier*. The leaves of this plant, which are indigenous in Great Britain, are powerfully sedative,—diminishing the velocity of the pulse, diuretic, and sorbent. In over-doses, Digitalis causes vomiting, purging, dimness of sight, vertigo, delirium, hicough, convulsions, and death:—all the symptoms in short, which characterize the acro-narcotic class of poisons. Its active principle has been called *Digitaline* or *Digitalin*, *Digitalinum* (Ph. B. 1864). It is said to be a hundred-fold stronger than the most active preparation of digitalis.

Digitalis has been administered in inflammatory diseases, phthisis, active hemorrhage, dropsy, &c.; but although it is a powerful remedy, it has not been as much employed as it probably would have been in particular cases, owing to the overstrained eulogiums, which many have passed upon it in almost all diseases. The average dose is one grain, in the form of pill, which may be repeated every six or eight hours.

DILATOR, AR'NOTT'S. A modification of the old dilators for strictures of the urethra. It consists of a tube of oiled silk, lined with the thin gut of some small animal to make it air-tight, and fixed on the extremity of a small canula, by which it is distended with air or water, from a bag or syringe at the outer end, whilst a stop-cock or valve serves to keep the air or water in, when admitted. Medicines which have been conceived proper for augmenting the fluidity of the blood and other animal liquids. All aqueous drinks are diluents. They are administered, with great advantage, in various diseases. In fever, water, which is the most familiar diluent, may be freely allowed; the only precaution being to give it *hot* in the cold stage, *cold* in the hot, and *tepid* in the sweating. In diseases, where it is considered necessary to abstract blood largely, diluents should not be given too freely. The abstraction of blood occasions activity of absorption, and the mass is speedily restored. It is also obvious, that in cases of inflammation of the mamme, in nurses, diluents should not be freely allowed, as they increase the secretion of milk, and add to the irritation. When *demulcents* are exhibited in cases of urinary disease, they act simply as diluents; their mucilaginous portion is digested in the stomach and small intestine,—the watery portion alone being separated by the kidney.

DISINFECTION, *Disinfectio*, (F.) *Désinsec-*

tion. The act of attempting to destroy mias-mata, with which the air, the clothing, &c., may be infected. Various means have been proposed for this purpose. Those most commonly em-ployed are: *chlorine*, *sulphurous* and *chlorohydric acid gases*, *vapours of vinegar*, *nitrous acid*, and what is, perhaps, the most manageable of any, *chlorinated lime*, or any of the chlorides of the alkalis. It is more than questionable whether any chemical action occurs between these agents and the miasmata, whence results a compound which is harmless, or in other words, whether there is any agent that is capable of destroying morbid miasms. Disinfection also includes the action of antiseptics.

The following fumigations have been largely employed as disinfectants.

Chlo'rine or *Oxy-muriat'ic Fumiga'tion*, *Solu'tio alexite'ria Gaubia'na*, *Fumiga'tio antiloin'ica Gan'bi*, *Alexite'rium chlo'ricum*, *Fumiga'tio Guy-tonien'sis*, is made by adding common salt 3ij, to black oxide of manganese 3j, sulphuric acid 3j, and water f3ij. This may be carried through an apartment, or be shut up in it.

The Pharmacopœia too, is published under the authority of, and by the members of a college or association; whilst a Dispensatory contains the whole of the Pharmacopœia or Pharmacopœias, with additions by the author, under whose authority alone it usually appears. DISTILLA'TION, *Destilla'tio*, *Stalag'mus*, (*destillare*, (*de* and *stillare*,) 'to drop, little by little,') *Catastalag'mus*. An operation, by which—by the aid of heat and in closed vessels—the volatile are separated from the fixed parts of bodies, with the view of collecting the former, when condensed in appropriate receivers. The product of distillation is the *distillate*, (G.) *Destillat*.

The ancients distinguished distillation *per latus*, *per ascensum*, and *per descensum*, according to the direction which the volatilized matters were made to take. In *distillation per latus*, the apparatus is so arranged, that the vapour passes horizontally through a succession of spaces before reaching the receiver. *Distillation per ascensum* is the ordinary method by the still. In *distillation per descensum*, the fire is applied above and around the top of the apparatus; and it is so arranged that the vapour must pass downwards. *Fractional distilla'tion* is when ingredients volatilized at different degrees of heat are separated from each other during the process. When dry organic matter is placed in an apparatus for distillation, and heat is applied until all volatile matter is driven out, the process is called *dry* or *destructive distillation*.

It is one of the most common varieties of worms, infesting the livers of the sheep, goat, ox, stag, fallow-deer, horse, ass, hog, hare, &c. The treatment is like that required for other worms. **DISTOMA** seu **DISTOMUM LANCEOLATUM**, a different species, has been found in the biliary ducts of man, and of different phytivorous mammalia.

It is of a fawn colour, from 3 to 5 lines in length, with an oval head, flattened and terminating in a point posteriorly; contained in a membranous sac, and furnished anteriorly, with a bifurcated, rugous horn. Laënnec considers it a vesicular worm or hydatid. According to Von Siebold, there is no such entozoon. The undigested seed of the mulberry, which had been eaten, was mistaken for it.

watery and other parts of the blood; and, by such discharge, indirectly promote absorption over the whole system. Hence, they are employed in dropsy. To this class belong squill, juniper, digitalis, &c. Some of them appear to affect the system of nutrition, by modifying the metamorphosis of tissue, and giving occasion to the separation of tissue materials from the blood by the kidneys. Hence they were called, by Dr. Golding Bird, *Renal alteratives*. To this class belong the alkalies, alkaline salts, &c.

Different proofs to which the organs of respiration of a new-born child are subjected, for the purpose of detecting whether it has or has not respired after birth; in other words, whether it was born alive or dead; —*Pneobiomanti'a*, *Pneobiomanti'a*. These consist, chiefly, 1. In testing the lungs with water, for the purpose of seeing whether they are specifically heavier or lighter than that fluid. This is called *Docimasia Pulmonum hydrostatica*, or the *Hydrostatic Test*. If lighter, it would be some evidence that the fœtus had respired; 2. In comparing the weight of the lungs with that of the whole body; the weight of lungs in which respiration has taken place being nearly twice as great. This is *Docimasia Pulmonum Stat'ica*, or *Plouquet's Stat'ic Test*; and, 3. DOLICHOS, (δολιχός, 'long,' as applied to the pods.) A genus of plants of the leguminous family, (F.) *Dolic*, *Dolique*. It includes a number of species, generally indigenous in India or America. The *Dolichos Lablab*, or *Lablab*, is found in Egypt. (Prospero Alpini.) Its fruit is eaten there, like the haricot with us. The *Dolichos Sinen'sis*, is eaten in China, and is stored up as a provision for long voyages. The *Dolichos Tuberosus* (F.) *Pois Patate* of Martinique, has tuberous roots of the size of both fists, and has the consistence and taste of the turnip. The *Dolichos Bulbosus* of the West Indies resembles the turnip;—and from the seeds of the *Dolichos Soja*, the Japanese prepare the well-known sauce *Soy*, which they term *Soja*. The most important in medicine is the

S.), are the parts used in medicine. They excite an intolerable, prurient sensation, when applied to the skin; but do not irritate the mucous membrane over which they pass, when administered internally. The *Dolichos* is a mechanical anthelmintic, and is useful in cases of ascarides lumbricoides, and oxyures vermiculares. Dose, gr. v to x, of the pubes, in molasses.

Muc'na pruri'ta, a distinct species, but possessing similar properties, grows in the East Indies.

It has received the name *Doloire* from its representing the obliquity of the edge of the instrument whose name it bears. See *Bandage*.

DOS, Dorsum.

DOSAGE, (from *dose*), Posology.

DOSE, *Do'sis*, (*do'sis*, from *didomi*, 'to give,') *Præbium*, (F.) *Prise*. The quantity of any substance, which ought to form part of a compound medicine, or ought to be exhibited singly, to produce a desired effect. Many circumstances influence the doses of medicine. Women require smaller doses, as a general principle, than men. *Habit* has a great effect, as well as *climate*, *age*, and *idiosyncrasy*: all these, and other circumstances, must be taken into account; and every general rule on the subject will be found to have numerous exceptions. Some of the mechanical physicians laid it down as a rule, that the doses of medicines must always be as the *square of the constitution*!—A matter not easy of calculation.

The following Tables will exhibit an approximation, but only an approximation, to the proper doses (according to age) of most substances.

TABLE OF DOSES ACCORDING TO AGE.

Age	Let the full dose be	1	1 drachm.
24	will require	2-3ds.	2 scruples.
18	- - -	half.	1 drachm.
14	- - -	1-3d.	1 scruple.
7	- - -	1-4th.	15 grains.
4	- - -	1-6th.	10 grains.
3	- - -	1-8th.	8 grains.
2	- - -	1-12th.	5 grains.
1	- - -		

The table of doses, according to age, recommended by Dr. Thomas Young, differs in some respects from the above. It, also, affords a general approximation. His rule is, that

For children, under twelve years of age, the doses of most medicines must be diminished in the proportion of the age to the age increased by twelve:

Thus, at two years, to 1-7th; i.e. $1-7th = \frac{2}{2+12}$

At twenty-one the full dose is given.

DOSES, BROKEN, (F.) *Doses refractées*. When an agent is given in small portions it is said to be in *broken doses*,—*refractis donibus*, (F.) & *Doses refractées*.

DOUCE-AMÈRE, ('sweet bitter,') *Solanum dulcamara*.

DOUCHE (F.), (modern Latin, *ducia*, (L.) *dociare*, 'to pour,') *Cataclysmus*, *Douse*. This term is applied to a column of fluid, of a determinate nature and temperature, let fall upon the body. *Pumping* is a variety of the *Douche*. In using this kind of bath, the fluid is directed upon the part on which we are desirous of acting. The *douches descendantes* are those in which the fluid falls from a height,—the *douches ascendantes*, those administered in diseases of the uterus,—the *douches horizontales*, where the fluid is impelled horizontally, &c. They may be *cold* or *warm*, according to circumstances. The apparatus consists of a reservoir of water having a pipe or plug, by means of which the water can be directed as the practitioner may desire. The *Douche* communicates a considerable and peculiar shock to the nervous system; and is one of the most successful means for taming the furious maniac. It is, also, useful in chronic rheumatism, stiff joints, &c.

Douches of air are occasionally used, as in cases of obstruction of the Eustachian tube by mucus. They are sent from an air-press—of which Deleau and Kramer have invented one each—through a catheter introduced through the nose into the tube.
